Up & Running

1

Getting o2c_Interactive! up and running is a simple matter with its flexible and interactive setup program. Use the "System Requirements" and "Pre-Installation Checklist" in this chapter to make sure you're ready to begin installing the program. The setup instructions that follow take you step-by-step through the installation process.

To get the most from this manual, please refer to "How to Use This Manual" in this chapter.

DATA CAD LLC offers 30 days of free installation support when you purchase o2c_Interactive!. If you have any questions about installing o2c_Interactive!, you can contact [DATA CAD LLC Technical Support](#) Monday through Friday, 8:00 a.m. - 5:00 p.m. eastern time, except during normally observed holidays, via phone at (860) 677-2829, via fax at (860) 677-2883, or via e-mail at techsupport@datacad.com.

In this chapter:

- ⊕ [How to use this manual](#)
- ⊕ [System requirements](#)
- ⊕ [Pre-installation checklist](#)
- ⊕ [Installing o2c_Interactive!](#)

How to Use This Manual

This manual introduces o2c_Interactive! to you. Once you understand how o2c_Interactive! works, you can apply the principles to your own projects.

The manual gives detailed explanations as well as step-by-step instructions on how to use each o2c_Interactive! function and menu to create different design schemes, save custom views, and develop your presentation. These instructions may include using keyboard shortcuts, selecting entities or objects, and choosing menu options.

Words or characters to be typed are printed in bold; type them exactly as they appear. Keys to be pressed are shown just as they appear on your keyboard, with parentheses around the character(s), as shown below:

Press [Enter].

Press [Ctrl] + [O].

Combinations like the second example above should be executed by pressing and holding down the first key, pressing the second key, then releasing both simultaneously.

Some instructions ask you to "click," "right-click," or "[Ctrl] + right-click" on a button, icon, or entity. To click on a button, move your mouse until your cursor arrow is over the button and then press the left mouse button once. To right-click, press the right mouse button once. To [Ctrl] + right-click, move your mouse until the cursor is over the button and press the [Ctrl] key at the same time you press the right mouse button. Right-clicking and [Ctrl] + right-clicking generally don't require specific placement of the cursor; however, it must be somewhere over the o2c_Interactive! window.

Getting Help in o2c_Interactive!

Help is easily accessible by pressing [F1] or by selecting o2c_Interactive! Reference Manual from the Help Menu in o2c_Interactive!. The reference manual is a PDF file that opens within the Adobe Acrobat Reader program. If you do not have the Adobe Acrobat Reader program on your computer already, o2c_Interactive! will try to redirect you to the Adobe website where you can download and install the freely distributable Acrobat Reader.

Installing o2c_Interactive!

To install o2c_Interactive! on your computer, first review the "[System Requirements](#)" and "[Pre-Installation Checklist](#)" sections below to make sure you have everything you need to install the program. Then follow the instructions in "[Running the Setup Program](#)" on the next page.

Information in this section requires you to be familiar with your computer hardware and your computer's operating system (Microsoft Windows 95/98/ME or Windows NT/2000/XP).

To check available free hard disk space prior to installation, double-click on the My Computer icon on your Windows desktop. Right-click on the drive you want to install o2c_Interactive! on and select Properties. The hard disk space already in use will be displayed as well as the amount that is still free.

System Requirements

Make sure you have the following minimum requirements to install and run o2c_Interactive! for Windows:

- Personal or multimedia computer with a Pentium-based processor (Pentium II or faster recommended)
- Windows 95 or later or Windows NT 4.0 or later (Windows 98 or later recommended)
- 64MB of memory for use on Windows 95/98/ME (128MB recommended); 128MB for use on Windows NT/2000/XP (256MB recommended)
- Minimum of 20MB free hard disk space for program installation.

To check available free hard disk space prior to installation, double-click on the My Computer icon on your Windows desktop. Right-click on the drive you want to install o2c_Interactive! on, and select Properties. The hard disk space already in use will be displayed as well as the amount that is still free.

- CD-ROM drive (if installing from a CD-ROM)
- SVGA (800x600), or better, resolution graphics card capable of displaying 16-bit color or better (3D hardware acceleration with support for DirectX7 or later recommended)
- Microsoft-compatible mouse or digitizer

Pre-installation Checklist

- Do you have the minimum system requirements for o2c_Interactive!?
- Where do you want to install o2c_Interactive!/? If you're upgrading your current version of o2c_Interactive!, install the new version to the same drive and folder so that the program is properly updated.
- If you're upgrading your current version of o2c_Interactive!, have you made a copy of your o2c_Interactive! folder to back up all your files before installing the new version? This is simply a precaution against losing any of your files.
- Remember to fill out and send in your registration card or register online to qualify for technical support benefits and to receive new product information as it becomes available.

Running the Setup Program

The o2c_Interactive! setup program guides you step-by-step through installing o2c_Interactive!. Please exit all Windows applications completely before running the o2c_Interactive! setup program.

➔ To install o2c_Interactive! on your computer:

1. Place the o2c_Interactive! CD-ROM in your CD-ROM drive; the setup program should start automatically. If it doesn't, click on Run in the Start menu. In the Open input box, type **e:\setup**, where "e" is the letter of your CD-ROM drive. Press [Enter] or click on OK. To cancel the installation at any time, press [Esc] or click Cancel.

Or follow the instructions on your screen to install the download version of o2c_Interactive!.

2. The setup program begins. Simply follow the instructions on the screen. To properly update your current version of o2c_Interactive!, install this new version to the same folder.
3. Once setup is complete, you can view the ReadMe file, which contains important information about o2c_Interactive! that is not documented anywhere else. Click Finish to complete the setup program and open the ReadMe file.

The setup program will ask you to enter your serial number. If you purchased o2c_Interactive! on CD-ROM, your serial number is printed on your registration card. If you received o2c_Interactive! as an Internet-deliverable, your serial number is the same as your invoice number. Be sure not to substitute the letter "O" for a zero when entering your serial number.

The Design Board

Think of your o2c_Interactive! screen as a stage where you can create a wide variety of design schemes. You will quickly learn how to take full advantage of the pull-down menu options, the icons, and the browsers to develop design alternatives.

In this chapter:

- ⊕ [Opening design files](#)
- ⊕ [The o2c_Interactive! screen](#)
- ⊕ [Menu options](#)
- ⊕ [Toolbars](#)
- ⊕ [Browsers](#)

Starting o2c_Interactive!

There are two ways to start o2c_Interactive! You can:

- Double-click on the o2c_Interactive! icon on your computer's desktop.

or

- Use the Start menu.

➔ To use the Start menu to open o2c_Interactive!:

1. Click on the Start button in the lower left corner of your screen.
2. Select Programs to display the list of the software available on your computer.
3. Scroll to o2c_Interactive! in the program listing to display the submenu options.
4. Click on o2c_Interactive! The o2c_Interactive! program is ready to help you develop design alternatives.

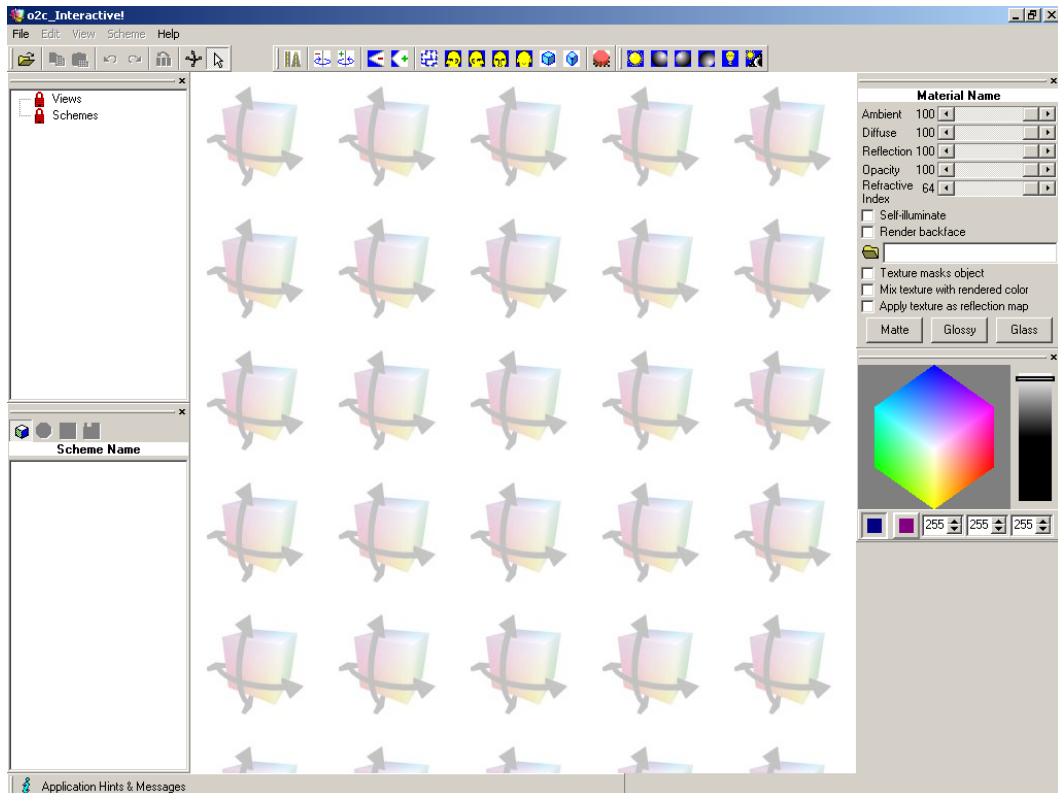

Figure 2.1: The o2c_Interactive! opening screen

If o2c_Interactive! does not start, review Chapter 1 to make sure you meet all [system requirements](#). You have 30 days of free installation support; see the first page of Chapter 1 for details on how to [contact us](#).

Opening a Design File

o2c_Interactive! allows you to work with files of three-dimensional objects, buildings, or designs that have either an .o2c or .aco suffix. There are two ways to open a design file in o2c_Interactive!:

- Select Re-Open from the File pull-down menu, highlight the appropriate file, and click or press [Enter].

or

- Select Open from the File pull-down menu to begin working with a new file. You can also use the [Ctrl]+[O] keyboard shortcut to open a new file. The Load Object dialog box appears. Highlight the appropriate file and click on Open or press [Enter].

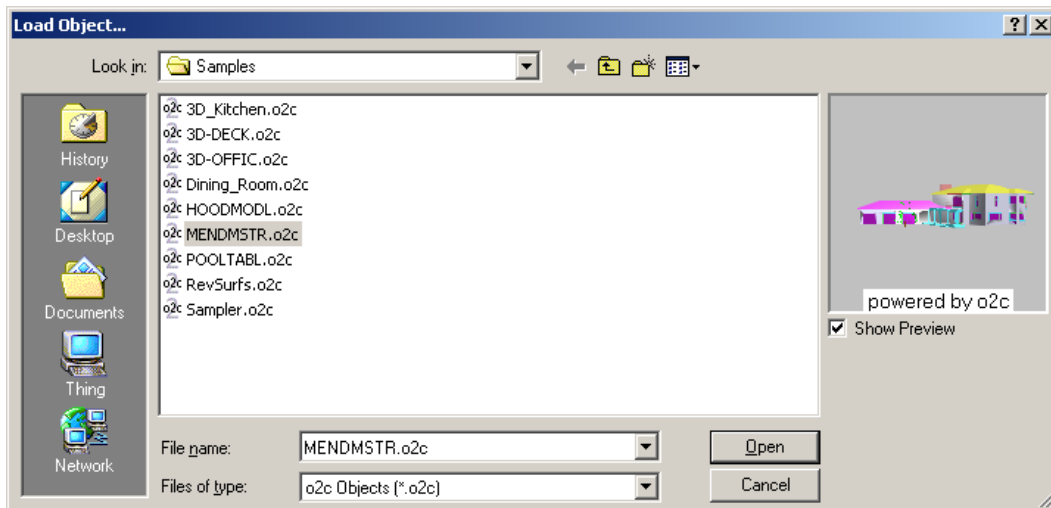

Figure 2.2: The Load Object dialog box

The file you load must have an .o2c or .aco suffix. For example, you could use a file called 3D_Kitchen.o2c or LAMP06.aco to load a three-dimensional room or an object. If there is a check in the Show Preview box, you will see a thumbnail sketch of the object before you load it into the player window. You can click on the preview object and rotate it with your mouse to see it from a different angle.

Use the Look in drop-down box or the Up One Level icon to find folders that contain the objects you want to experiment with using o2c_Interactive! the Files of type drop-down box offers the suffixes for o2c Objects (*.o2c) or ArCon Objects (*.aco). You can also use the icons in the left panel of the Load Object dialog box to help you search for the appropriate file based on when you last used it (the History icon) or where it is stored (the icons for Desktop, Documents, various drives on your computer, or Network). In the Load Object dialog box above, the computer's name is either My Computer (the Windows default) or whatever your system administrator decided to call it. This particular computer was named "Thing"; therefore, the fourth icon in the left panel is also called Thing.

If only a portion of the entire object you loaded in the Player Window is visible, you can use the Views pull-down menu and select Plan, Elevation (further divided into Front, Back, Right, and Left), Isometric, and Axonometric. Alternatively, you can click on the toolbar options to switch between parallel and perspective views or one of the other View icons.

A Brief Tour of the o2c_Interactive! Screen

The o2c_Interactive! screen has several parts. These include the Title Bar, Pull-down [Menu Bar](#), and [Icon Toolbar](#) along the top of the screen. An [Information Toolbar](#), at the bottom of the screen, contains more details about the object your cursor is currently highlighting.

The rest of the screen is divided into five parts. The contents of the file you opened are displayed in the Player Window. The [Views/Schemes Browser](#) in the upper left corner displays available saved views and schemes associated with the object. The [Material Browser](#) in the lower left corner shows the active list of materials. The [Material Properties Browser](#) in the upper right corner gives you maximum control over the object(s) in the Player Window. Finally, the [Material Color Picker](#) lets you experiment with a broad spectrum of shades and hues for the object(s) in the Player Window.

Technically, the Views/Schemes Browser, the Material Browser, the Material Properties Box, and the Color Picker are toolbars. You can leave these four toolbars docked on either side of the Player Window. If you prefer, you can undock them and position them anywhere within the Player Window.

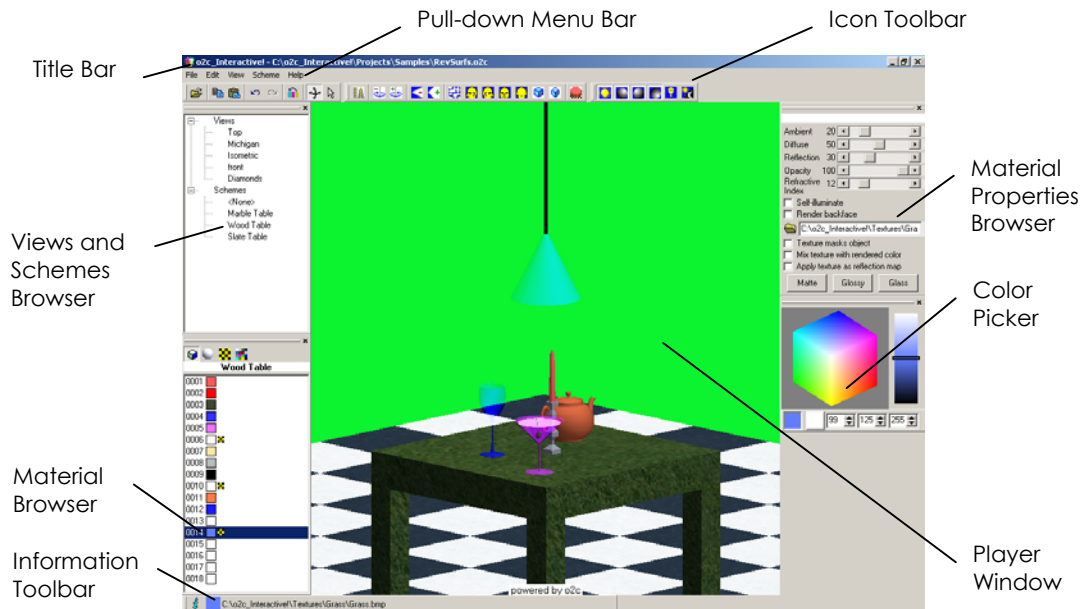

Figure 2.3: The o2c_Interactive! screen is divided into several parts.

You use the options from the pull-down Menu Bar, the Icon Toolbar, the Views and Schemes Browser, the Material Browser, the Material Properties Browser, and the Color Picker to control the appearance of the object(s) in the Player Window.

Pull-down Menu Bar

The pull-down Menu Bar is located along the top of the o2c_Interactive! screen and contains the File, Edit, View, Scheme, and Help pull-down menus. These menus give you quick access to many of o2c_Interactive!'s most frequently used features.

Notice that some menu options have keyboard shortcuts associated with them. For instance, the Open option in the File menu has [Ctrl]+[O]. Instead of using the mouse to choose a menu option, you can simply press the keyboard shortcut to quickly do the same thing.

➔ To choose an option from the Pull-down Menu Bar:

1. Click on the menu name in the pull-down Menu Bar. The menu will drop down, displaying all the options in it.
2. Move your mouse down the menu to the option you want. Notice that each option highlights as your mouse passes over it.
3. Click on the option you want to select.

Toolbars

There are eight toolbars in the o2c_Interactive! program: Standard, Views, Lights, Views/Schemes Browser, Material Browser, Material Properties, Color Picker, and Information. The Standard, Views, and Lights toolbars contain icons that you can click on to perform different tasks. The Views/Schemes Browser, Material Browser, Material Properties, and Color Picker toolbars are larger rectangular boxes. You can resize the box-shaped toolbars, except for the Material Properties one.

You control which toolbars appear on your screen via the Toolbars option in the File pull-down menu. Only the toolbars that are preceded by a checkmark will appear on your screen.

You can either dock (the default) these toolbars around the perimeter of the Player Window or undock them to reposition them where it is most convenient for your purposes.

➔ To reposition a docked toolbar:

1. Use the left mouse button to find the bar located at the left edge (Standard, Views, Lights, and Information toolbars) or top (Material Browser, Material Properties, Color Picker, and Views/Schemes Browser toolbars). The cursor will change to a four-direction arrow when it is positioned on the bar.
2. Click on the bar and keep the left mouse button depressed.
3. Drag the toolbar to a new position around the perimeter of the o2c_Interactive! screen.

➔ To undock a toolbar:

1. Use the left mouse button to find the bar located at the left edge (Standard, Views, Lights, and Information toolbars) or top (Material Browser, Material Properties, Color Picker, and Views/Schemes Browser toolbars). The cursor will change to a four-direction arrow when it is positioned on the bar.
2. Click on the bar and keep the left mouse button depressed.
3. Drag the toolbar to a new position anywhere in your Player Window. When a toolbar is undocked, its name will be displayed in a title bar.

➔ To dock an undocked toolbar:

1. Click on the undocked toolbar's title bar and keep the left mouse button depressed.
2. Drag the toolbar to where you want to dock it around the perimeter of your Player Window. You'll know you have successfully docked the toolbar when its name disappears from the title bar and a blank bar appears along its left edge or top.

You can double-click on the title bar of any toolbar to quickly return it to its previous undocked or docked position.

Notice that the docked toolbars assume the width and height of their undocked shapes. If more than one toolbar is docked at the side of the Player Window, they will all take on the width of the toolbar that was widest in its undocked form. You can change the shape of the Material Browser, Color Picker, and Views/Schemes Browser toolbars; however, you cannot change the width or height of the Material Properties toolbar.

You may place these four toolbars on one side of the Player Window, on both sides of it, or hide one or more of them. For example, to hide the Color Picker toolbar, you could select Toolbars from the File pull-down menu and make sure there is no check in the Color Picker box.

Although the Material Browser, Color Picker, Views/Schemes Browser, and Material Properties boxes are technically toolbars, `o2c_Interactive!` calls them "browsers" because they offer many more options that you can directly control than do the icon toolbars.

Icon Toolbar

Below the Pull-down Menu Bar, you can display the icons that will help you control your project. A list of the toolbars and browsers that are available is in the File pull-down menu. You can display the toolbars and browsers that you find most useful and hide those that you rarely use. You can arrange the three toolbar icon groups in any configuration that you want. If you turn off all the toolbars and browsers, your design project fills the entire screen below the Pull-down Menu Bar.

There are three toolbars of icons that you can display below the Pull-down Menu Bar:

- Standard** This toolbar contains the traditional Windows file open, save, copy, paste, and undo/redo icons. In addition, there is a Reset icon that restores the material properties that existed before you edited them with the Material Properties Browser. You also have two cursor options: navigate  and select . The navigate cursor allows you to rotate and reposition the design in your Player Window. The select cursor allows you to highlight the portion of your design that you want to change by using o2c_Interactive!'s many features.
- Views** This toolbar displays the icons that control the view of your design project. You can switch between parallel and perspective view, rotate clockwise or counterclockwise around the Z axis, and increase or decrease your field of vision. You can use the icons to switch among plan, elevation, isometric, and axonometric views of your project. The final icon lets you preview a raytraced rendering of your design.
- Lights** This toolbar controls the lighting. You can toggle these lights on or off. You can switch sunlight on or off, control three ambient light sources, use lamps, or toggle between day and night lighting.

Figure 2.4: Icon toolbar groups can be rearranged to suit your needs.

Information Toolbar

The Information Toolbar describes the color and other properties of the object that you touch with your selection cursor. You can turn the Information Toolbar on and off through the File pull-down menu.

Figure 2.5: The Information Toolbar

Browsers

Although technically toolbars, the Views/Schemes Browser, Material Browser, Material Properties, and Color Picker are collectively called “browsers.”

Views/Schemes Browser

You can display or hide the Views/Schemes Browser box and position it anywhere in your Player Window. Switching between different views and schemes is easily accomplished with a click of the mouse.

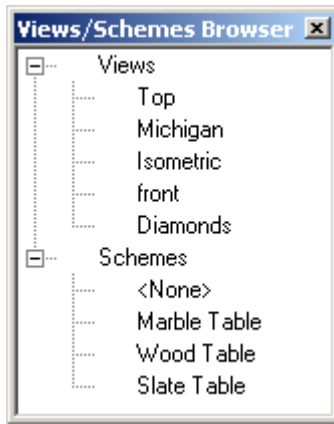

Figure 2.6: The Views/Schemes Browser

Material Browser

In the Material Browser, you can see the colors and properties associated with the various objects within your design project. The four icons within this browser control what appears in the browser's list of objects that are included in your design project. From left to right, the icons are:

- Object Material list
- Available material definitions
- Available bitmap textures
- 255-color custom palette

Figure 2.7: The Material Browser

You can place the Material Browser anywhere on your screen.

Material Properties Browser

You can fine-tune a selected material's properties and its rendered display. The five slider bars let you control how the object is affected by light and various conditions. There are five check boxes that further control illumination, rendering, and textures. The textures check boxes are not available if the surface cannot accept a texture. The Matte, Glossy, and Glass buttons automatically apply predetermined properties to a given object.

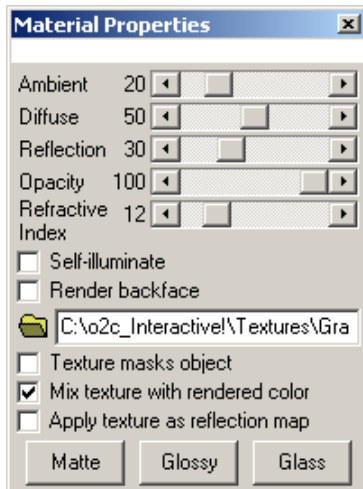

Figure 2.8: The Material Properties control box

You can place the Material Properties browser anywhere on your screen.

Color Picker

You can control the new color of the selected object in your design project by clicking on the cube, using the hue slider bar, or entering new values in the hue, saturation, and brightness control boxes. On the bottom of the Color Browser, you can compare the new color to the original one. Right-click and drag to spin the color cube.

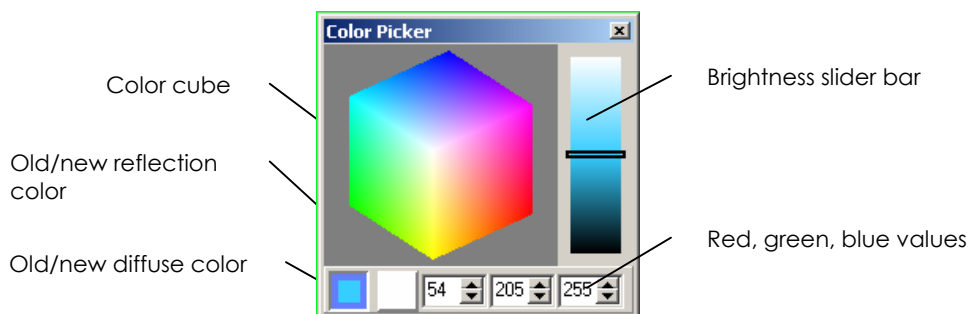

Figure 2.9: The Color Picker

Establishing Views

Views and schemes are important parts of developing your presentation using o2c_Interactive!. At first, you can develop several alternative views of your design project.

In this chapter:

- ⊕ [Using the navigation cursor](#)
- ⊕ [Using Views Toolbar icons](#)
- ⊕ [Saving, displaying, and switching views](#)
- ⊕ [Changing the background](#)

Working with Views

o2c_Interactive! lets you develop and save a variety of views. Views affect the position of the design project displayed in the Player Window. When you work with views, you will be using mainly the View pull-down menu, the Views Toolbar, and the Views/Schemes Browser.

You will be able to associate different design schemes with each view. Then, you will use the Views/Schemes Browser to recall your schemes and present them from different vantage points.

There are many ways to change the view of the design project displayed in your o2c_Interactive! Player Window. You can use the options available through the View pull-down menu or you can click on one or more of the icons on your toolbar. After you establish a new view of the design project, you can save or modify it.

Let's explore some of the options in the view arsenal.

The Navigation Cursor Changes Views

In the Standard Toolbar, the navigation cursor looks like an anchor. This special cursor lets you dynamically change the view of the design project.

➔ To use the navigation cursor to change views:

1. Open a design project that was stored as an .o2c or .aco file. In this case, we are using the Kitchen.o2c file that was developed with the DataCAD architectural program.
2. Click on the navigation cursor in the Icon Toolbar. Your cursor now looks like an anchor.
3. Position the navigation cursor within the Player Window and use it to dynamically change the position or magnification of the design project.
 - Hold down the left mouse button while you drag to the left, to the right, up, down, clockwise, or counterclockwise on your mouse pad. Notice how your view changes. You can even flip the design upside down!
 - Hold down the right mouse button and drag downward (toward yourself) on your mouse pad. Notice that the cursor now looks like a magnifying glass. This magnifies (or increases the size of) the design project in your Player Window.
 - Hold down the right mouse button and push upward (away from yourself) on your mouse pad. Notice that the cursor now looks like a magnifying glass. This minimizes (or decreases the size of) the design project in your Player Window.
4. Release the mouse button when you are satisfied with the view.

You can also change the view without using the mouse. Just tap the [Arrow] keys to control left, right, up, and down movements in your Player Window.

Using the Icons in the Views Toolbar

You can click on the icons in the Views Toolbar to change the way you see the current design project. Each icon or grouping has a different effect on the view that is displayed in the Player Window:

- Parallel/perspective Switches between these two view types
- Rotate clockwise
- Rotate counterclockwise
- Fields of view Two icons decrease or increase the field of view
- Plan Toggles on the orthographic or plan view
- Elevations Select right, left, front, or back elevation view
- Isometric Show the isometric view
- Axonometric Display the axonometric view
- Raytrace Render with shadows and reflections

Figure 3.1: The Views Toolbar icons

Saving, Displaying, and Switching Views

It is easy to save each view, display the one you want to work with, and switch among several views. Views are saved on your computer with a .gtv suffix.

➔ To save the view that is currently displayed in the Player Window:

1. Select Add View from the View pull-down menu. The Add View dialog box appears.

Figure 3.2: The Add View dialog box

2. Type a meaningful name for the view in the input box. Use only the upper- or lower-case letters, the numbers 0 through 9, and/or spaces for the view name. Do not use any punctuation marks.
3. Press [Enter] or click on OK.

➔ To save the changes you made to a view:

1. Select a view and make the changes you want.
2. Select Update View from the View pull-down menu. The Update View dialog box appears.
3. Click on the drop-down arrow to display the names of the views you created for this design project.
4. Select one of those views and press [Enter] or click on OK.

Figure 3.3: Select the name of the view you want to update.

➔ To display the list of views you created and named, you can either:

- Click on the [+] button next to Views in the Views/Schemes Browser. The names of the views appear in the Views/Schemes Browser.

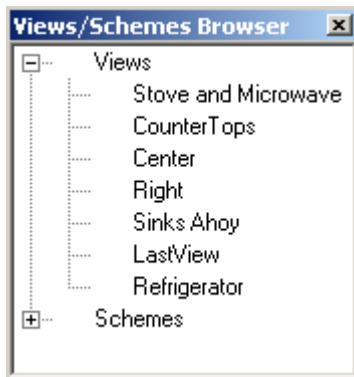

Figure 3.4: The views you created and named are displayed in the Views/Schemes Browser.

Or

- Select Views from the View pull-down menu. The names of the views appear in an extended menu.

- ➔ To switch from the current view to a different one, you can either:
- Click on [+] beside Views to display saved views. Then, click on the name of the view you want in the Views portion of the Views/Schemes Browser.

Or

- Select Views from the View pull-down menu. Then select the name of the view you want to display from those listed in the extended menu.

Changing the Background

You can change the view by altering the background of the Player Window with a color or bitmap image. You can also select a different display mode.

- ➔ To change the background color of the Player Window:
1. Right-click within the Player Window. A menu appears.
 2. Select Background. The Background dialog box appears.

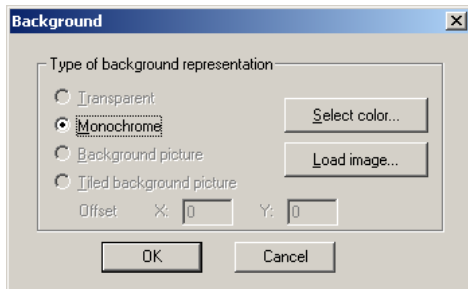

Figure 3.5: Background dialog box

3. Make sure the Monochrome option is activated.
4. Click on the Select color . . . button. The Color palette dialog box appears.

Figure 3.6: Color palette dialog box

5. Select a color from the options available or mix your own by clicking on the Define Custom Colors button to expand the dialog box. By clicking within the color window, using the slider bar, or typing numbers in the Hue, Saturation, Luminosity, Red, Green, and/or Blue input fields, you can fine-tune your selection. When you are satisfied with what appears in the larger swatch, you can click on the Add to Custom Colors button to transfer your mixture to the smaller custom color squares to the left.

Figure 3.7: The expanded Color palette dialog box lets you create custom colors and add them to your background options.

6. Choose the background color by highlighting the swatch from the Basic or Custom options on the left side of the expanded Color dialog box.
 7. Click on OK or press [Enter] to return to the Background dialog box.
 8. Click on OK or press [Enter] to leave the Background dialog box and activate your new background color.
- ➔ To use a picture in the background of your Player Window:
1. Right-click within the Player Window. A menu appears.
 2. Select Background. The Background dialog box appears.
 3. Click on the Load image button. The Load background image dialog box appears. Notice that you can use images that have .bmp or .jpg file suffixes.

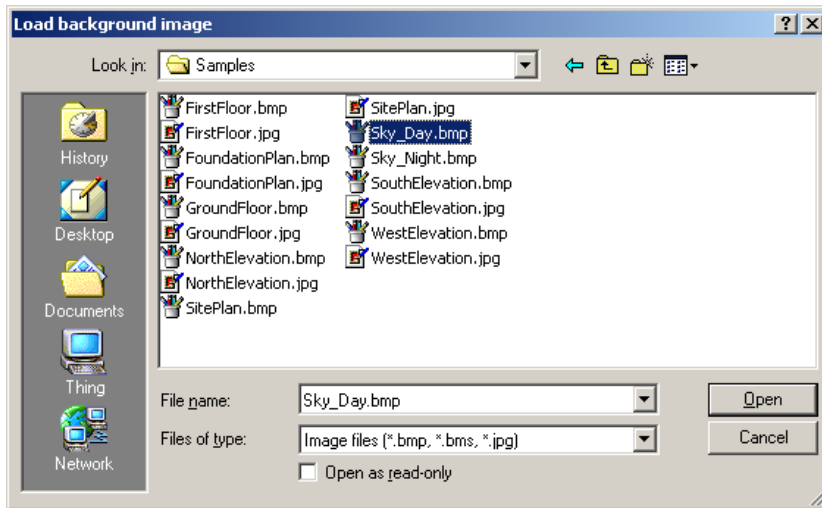

Figure 3.8: Select a background image.

4. Use the icons next to the Look in box to browse through folders that contain image files with an acceptable suffix.
5. Highlight the file you want to use as a background image. The name appears in the File name input box.
6. Click on Open or press [Enter]. The Background dialog box reappears. Notice that there are now three available options and that Background picture is highlighted.
7. Click on OK or press [Enter]. The image you selected appears as a background in your Player Window.

You can display several copies of the background image in tiles. Images that are not tiled are stretched to fit the entire width and height of the Player Window. The resolution need not be wider than 2,048 pixels because that is the maximum width allowed for rendered output. Tiled backgrounds are anchored to the upper-left corner of the Player Window. The X and Y offset values are relative to the upper-left corner of the Player Window. Since tiled backgrounds are not stretched to fit the Player Window, this option should be used when you superimpose your model over a digital photograph.

➔ To display several copies of the selected background image in tiles:

1. Select a background picture by following steps 1 through 6 of the previous procedure.
2. Click in the circle beside Tiled background picture. The X and Y Offset input boxes are activated. (The X and Y offset is a value in pixels. So if you want to shift the origin or starting point of your bitmap tiles, you can. You have to consider the size in pixels of your background image and the size in pixels of the Player Window.)
3. Type a value in the X input box and another value in the Y input box. The X option indicates the number of times the background picture should be repeated horizontally. The Y option indicates how often it should be repeated vertically.

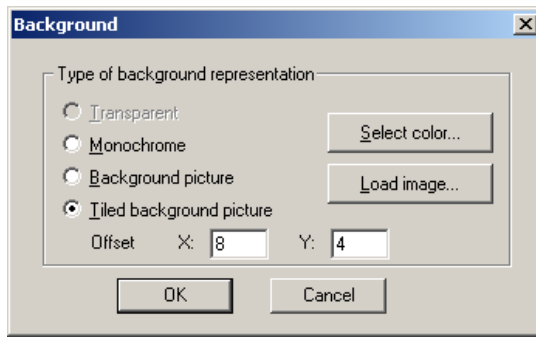

Figure 3.9: The picture you selected will be tiled in the background of your design project in the Player Window.

4. Click on OK or press [Enter]. The picture you selected is tiled as you indicated in the Background dialog box.

Figure 3.10: Tiled images appear as a background for the design project in your Player Window.

Changing the Display Mode

Altogether, there are five display modes: wireframe, flat shaded, flat shaded/textured, shaded/textured, and wireframe hidden line removal. A checkmark precedes the name of the currently active display mode. The o2c_Interactive! default display mode is shaded/textured.

The display mode is the global feature that affects the appearance of all your views. Switching to a different display mode changes the appearance of all the views you created because they assume the characteristics of the current (or checkmarked) mode.

In some cases, it may be easier to show your client a design that uses a different display mode. For example, if you switch to wireframe/hidden line removal mode in one of your saved views, all the other views in your design project will be displayed in the same mode. Then switch back to the normal shaded/textured mode for regular o2c_Interactive! views.

➔ To change the display mode:

1. Right-click within the Player Window. A menu appears.
2. Select Display mode to reveal an extended menu with more options. Normally, o2c_Interactive! uses the Shaded/textured display mode.
3. Click on the display mode you want.
 - Wireframe – shows colors, no surfaces or textures
 - Flat shaded – shows colors, no textures
 - Flat shaded/textured – shows colors and textures, no shading
 - Shaded/textured – shows colors and textures, with shading
 - Wireframe/hidden line – shows no colors or textures, just surfaces and edges

In this example, we show the wireframe/hidden line view that contains no colors or textures.

Figure 3.11: The Wireframe/hidden line display option of the kitchen

4. Switch to another display mode (such as the default flat shaded/textured to take advantage of the o2c_Interactive! rendering capabilities).

The Filter option causes the Player to smooth the edges of polygons to produce a higher-quality preview. However, this option slows performance, so it should be turned off.

Using the Controlbars

Controlbars can help you quickly navigate around the o2c_Interactive! screen. In addition to the normal sliding bars on the right and bottom Controlbars, there are four options in the lower right corner.

➔ To display the Controlbars:

1. Right-click anywhere within the Player Window. A menu appears.

2. Activate the Controlbars by clicking on the *No controlbars* option. When a checkmark appears in front of this option, the bars are not displayed; when there is no checkmark in front of this option, the bars are visible.

➔ To use the Controlbars:

- Move the slider bars to reposition the design in your Player Window. The slider bars and their associated “elevator” cars do not usually appear if the design is not enlarged. You can either click on and drag the slider bar to reposition the project dynamically or you can click on the [Arrow] buttons at either end of each slider bar to move the design incrementally left, right, up, or down. Using the [Arrow] buttons produces minimal changes, so most people don’t often bother with them. Clicking on a part of the Controlbar where there is no “elevator” car rapidly repositions the design.

Figure 3.12: Controlbar buttons appear in the lower right corner.

- Click on the [+] button in the lower left portion of the Controlbars to zoom in on the project in the Player Window.
- Click on the [-] button in the lower left portion of the Controlbars to zoom out on the project in the Player Window.
- Click on the [a] button in the lower left corner of the Controlbars to show the extents of the project in the Player Window.
- Click on the [R] button in the lower left corner of the Controlbars to begin raytracing the project in the Player Window. This has the same effect as clicking on the Raytrace icon in the toolbar.

Developing Schemes

Views and schemes are important parts of developing your presentation using o2c_Interactive!. At first, you can create several views of your project. Then, you can create a variety of schemes that influence the appearance of various elements of your design. Finally, you can experiment by pairing different schemes with the views you developed to show your client a variety of design alternatives.

In this chapter:

- ⊕ [Working with schemes](#)
- ⊕ [Using the Material and Material Properties Browsers](#)
- ⊕ [Using the Color Picker](#)
- ⊕ [Controlling lights](#)
- ⊕ [Raytracing](#)
- ⊕ [Batch rendering](#)

Working with Schemes

o2c_Interactive! lets you develop and save a variety of schemes. Schemes affect the way colors, textures, and materials of different entities within your design project appear. You will be able to recall different schemes from each view. This gives your client a wealth of design alternatives to explore.

When you are developing different design schemes, you will be using the Scheme pull-down menu, the [Material Browser](#), the [Material Properties Browser](#), and the [Color Picker](#). Then, you will use the Views/Schemes Browser to see the effect your schemes have when they are applied to the saved views.

When you first open a design project, the only thing that appears in the Schemes portion of the Views/Schemes Browser is <None>. After you develop several alternative schemes, simply click on <None> to return to the original state of your design project. The same list of alternatives appears when you select Schemes from the Scheme pull-down menu.

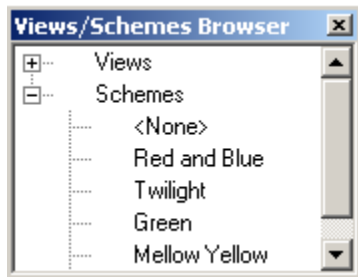

Figure 4.1: The original state of your design is available when you click on <None> in the Views/Schemes Browser.

Using the Material and Material Properties Browsers

The Material Browser and the Material Properties Browsers are closely related.

Material Browser

The Material Browser's built-in icon toolbar gives you quick access to options available from the Material Properties Browser and the Color Picker. If you make changes to the material properties of an object, but you don't like the modifications, you can click on the Reset icon in the Standard toolbar to restore the object's previous material properties. The Reset icon is greyed or unavailable if you have not changed an object's material properties recently.

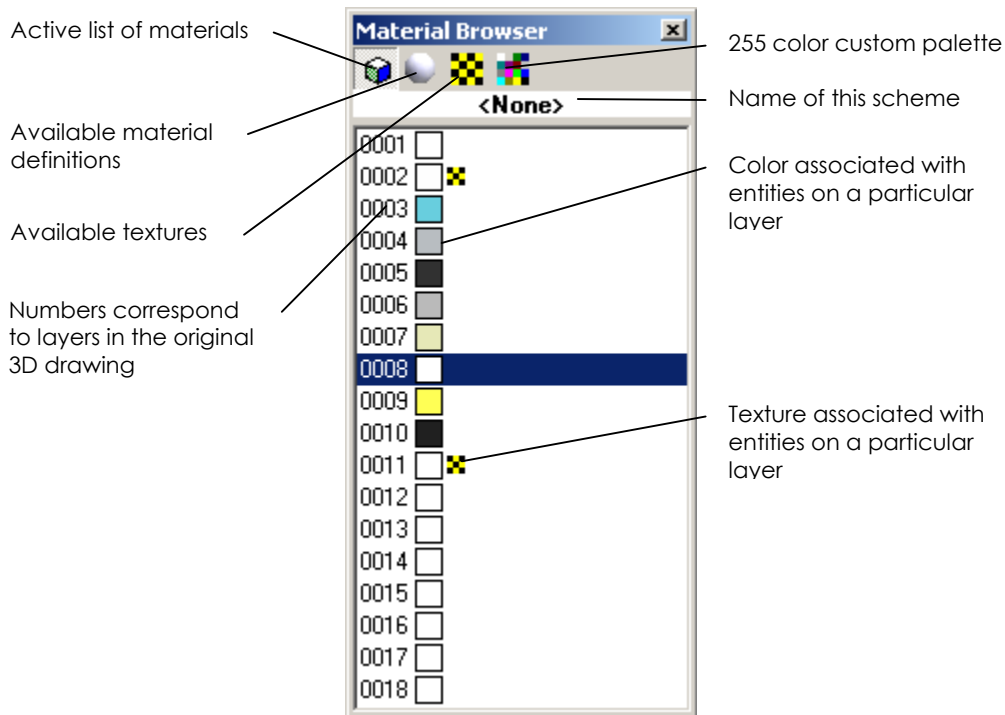

Figure 4.2: Parts of the Material Browser

Let's start building a new scheme for the kitchen. The first thing you should do is to give the new scheme a meaningful name.

➔ To create and name a new scheme in the Views/Schemes Browser:

1. Click on <None> in the Schemes portion of the Views/Schemes Browser. If the [+] button appears before Schemes, click it to display the list of available schemes for your project. <None> is the name of the original scheme developed from the 3D drawing.
2. Develop the new scheme.
3. Select Save As from the Scheme pull-down menu. The Save As Scheme dialog box appears.

Figure 4.3: The Save As Scheme dialog box

4. Type your name for the scheme in the input box. Use only the upper- or lower-case letters, the numbers 0 through 9, and/or spaces for the scheme name. Do not use any punctuation marks.
5. Click OK or press [Enter]. Notice that the scheme's name appears in the Schemes portion of the Views/Schemes Browser and at top of the Material Browser. Schemes are saved on your computer with the .msc suffix.

After you make changes to the materials used in this scheme, you can use the Save option from the Scheme pull-down menu to update and save the changes to your scheme.

When you scroll down to Schemes in the Scheme pull-down menu, a list of available schemes appears in an extended menu. This same list appears in the Schemes portion of the Views/Schemes Browser, so you can select a scheme from either listing.

Supplying Material Names

If you cannot relate to material numbers as easily as you can to words, you can name each one.

➔ To give a name to a material:

1. Make sure that you click on the first icon (shaped like a cube) in the Material Browser to show the active list of materials.
2. Click on a material number within the Material Browser. Notice that the entities affected by this material are highlighted in the Player Window. (In the kitchen, the microwave, stove, and refrigerator were highlighted.)
4. Place your cursor anywhere in the colored bar within the Material Browser and right-click. A menu appears beside the cursor.

Figure 4.4: Right-click to reveal this menu within the Material Browser.

5. Click on Edit Material Name. The Material Name dialog box appears.

Figure 4.5: Supply a meaningful name for the material affected.

6. Type a name in the input box. Use only the upper- or lower-case letters, the numbers 0 through 9, and/or spaces for the material name. Do not use any punctuation marks.
7. Click on OK or press [Enter]. The name appears in the Material Browser's list.
8. Continue giving other materials meaningful names.

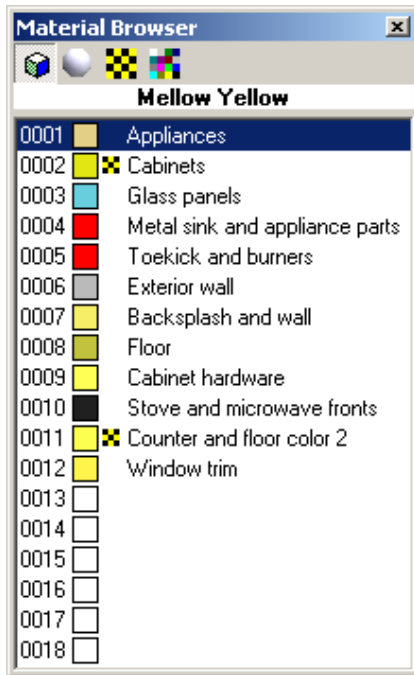

Figure 4.6: Names are applied to all the materials available in this project. Numbers 0013 through 0018 are lamps, but they contain no materials and have not been named.

➔ To change a material's name:

1. Right-click on the name you want to change in the Material Browser's list.
2. Select Edit Material Name from the menu that appears beside the cursor. The old name is highlighted in the Material Name dialog box.
3. Type a new name in the input box. Use only the upper- or lower-case letters, the numbers 0 through 9, and/or spaces for the material name. Do not use any punctuation marks.
4. Click on OK or press [Enter]. The new name appears in the Material Browser's list.

➔ To clear a material's name and leave it blank:

1. Right-click on the name you want to eliminate.
2. Select Clear Material Name from the menu that appears beside the cursor. The name disappears from the Material Browser's list, but the index number remains.

Using Pre-defined Materials

In the Material Browser, clicking on the spherical icon displays a list of pre-defined materials. The pre-defined materials have matte, glossy, or glass finishes.

➔ To work with the pre-defined finish for a given material:

1. Display the materials list (make sure the first icon in the Material Browser is active). Then, highlight the item you want to change. Alternatively, you can click on the item you want to change in the Player Window to highlight the appropriate material in the Material Browser list.
2. Click on the spherical icon (the second icon from the left in the Material Browser). Notice that two new icons appear below the first four. If the second icon is activated, options from all the materials are available from the subfolders. If you want to limit the materials, click on the single folder to display the Material Folder dialog box and make further decisions about the surface (choosing from Glass, Glossy, or Matte finishes) and the color you want for that object. Then, click OK or press [Enter]. A “list” of globes or spheres appears in the Material Browser.

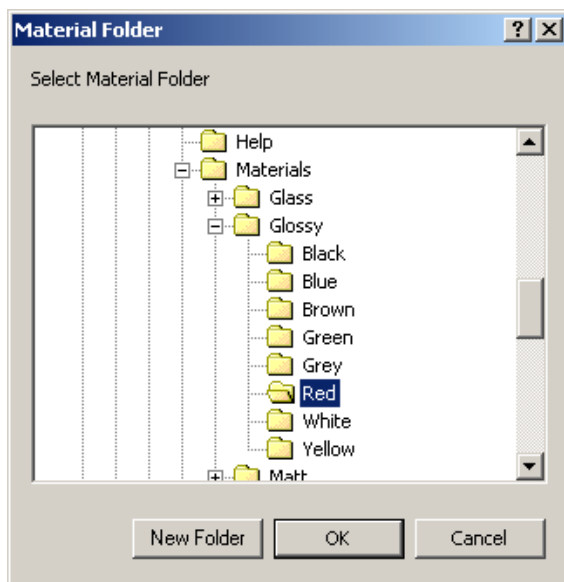

Figure 4.7: Material Folder dialog box

3. Click on a globe to see how its properties affect the object(s) in your Player Window. Notice that the Information toolbar displays the name of the color.

You can display either small or large globes in the Material Browser list. To display the small globes, right-click on one and select Small Previews from the pop-up menu. To display the large globes, right-click on one and select Large Previews from the pop-up menu.

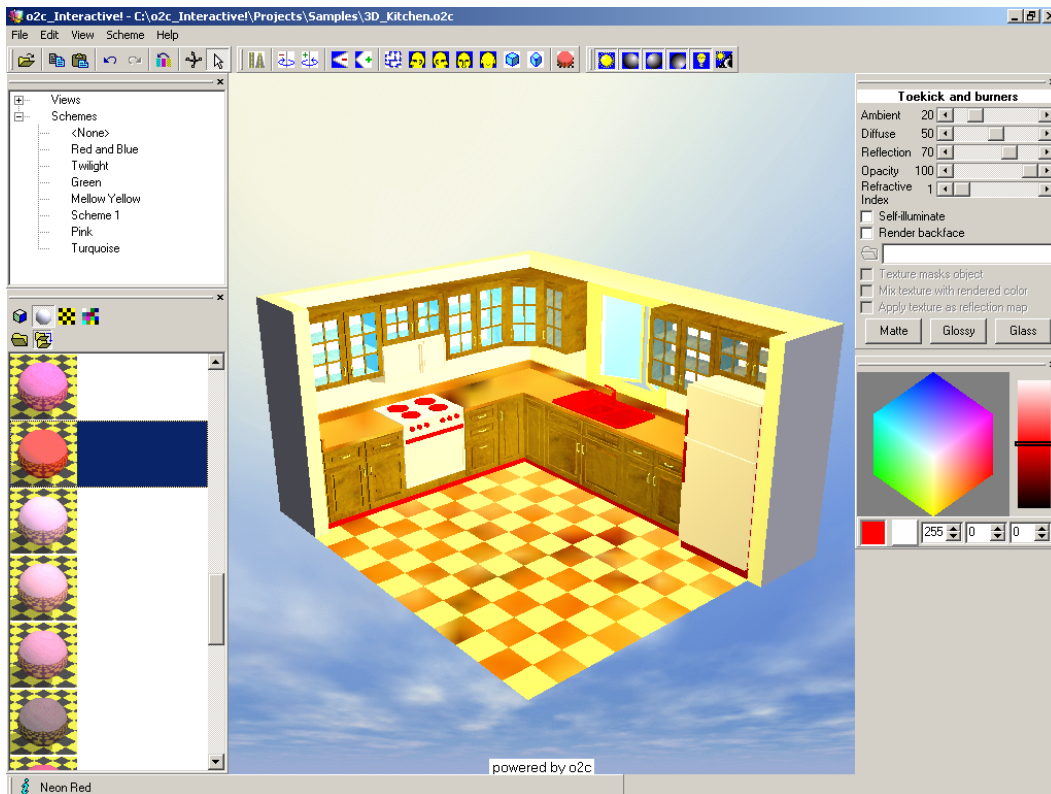

Figure 4.8: Selecting the neon red globe from the Glossy options presented in the Material Browser affects the toekick and burners in the Player Window as well as the contents of the Material Properties Browser and the Color Picker.

Applying Textures

The third icon from the left in the Material Browser controls an object's texture. Just as with the pre-defined materials, two file icons appear below the first four.

➔ To apply a texture to an object in your Player Window:

1. Display the materials list (make sure the first icon in the Material Browser is active) . Then, highlight the item you want to change. Alternatively, you can click on the item you want to change in the Player Window to highlight the appropriate material in the Material Browser list. You cannot change the texture of a material if there is no checkerboard button before its name in the Material Browser list.
2. Click on the checkerboard icon (the third icon from the left in the Material Browser). Notice that two new icons appear below the first four. If the second icon is activated, options from all the textures are available from the subfolders. If you want to limit the textures, click on the single folder to display the Texture Folder dialog box, select the appropriate subfolder, and click OK or press [Enter]. A "list" of texture samples appears in the Material Browser. (Some subfolders contain only one texture sample while others contain several.)

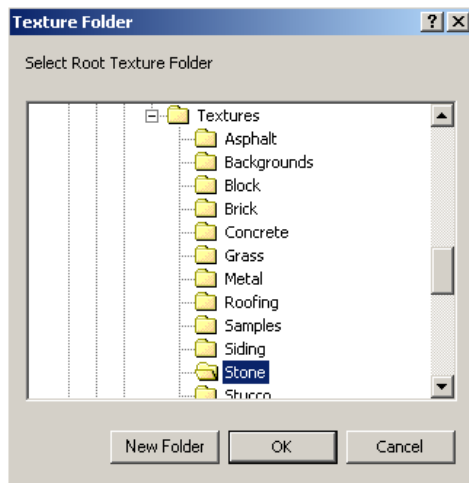

Figure 4.9: Texture Folder dialog box.

3. Click on a texture sample from the list of options in the Material Browser to see how it affects the objects in the Player Window. The texture file's name also appears in the Material Properties Browser.

You can display either small or large texture samples in the Material Browser list. To display the small samples, right-click on one and select Small Previews from the pop-up menu. To display the large texture samples, right-click on one and select Large Previews from the pop-up menu.

4. Make further decisions in the Material Properties Browser and the Color Picker to refine the appearance of the texture.

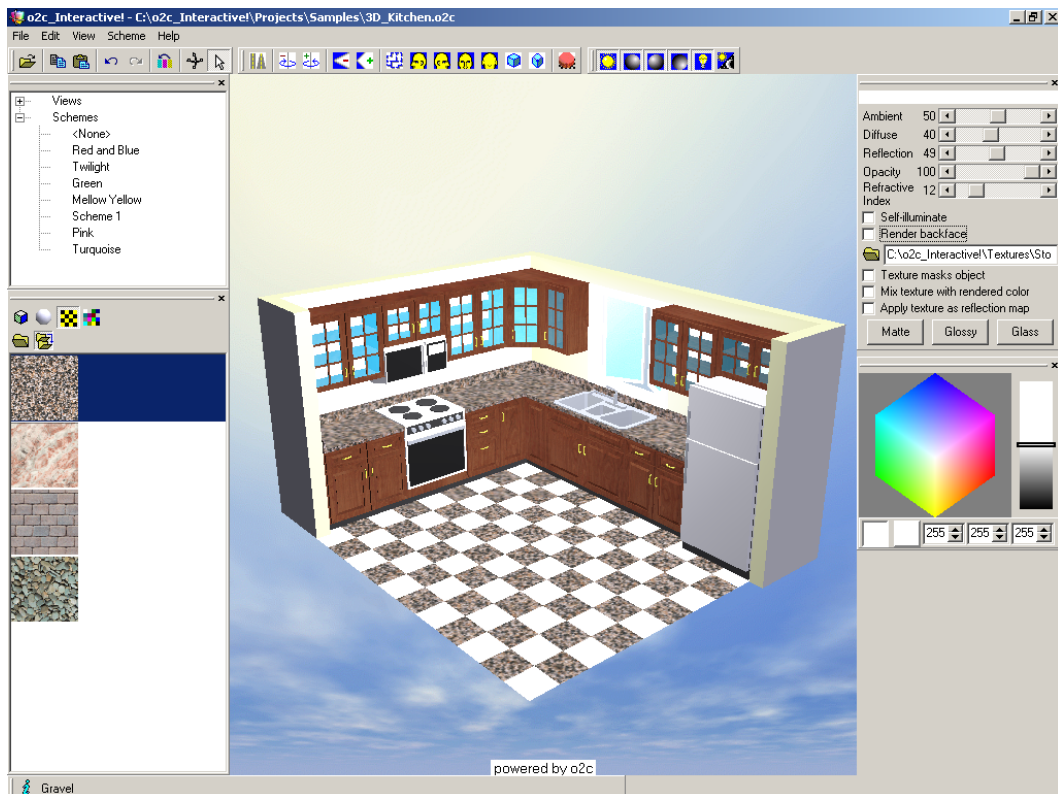

Figure 4.10: Selecting the granite texture affects the appearance of the counters and the floor tiles in the Player Window as well as the contents of the Material Properties Browser and the Color Picker.

Material Properties Browser

The Material Properties Browser gives you additional control of the materials that you specified in the Material Browser.

When you apply a texture to an object, more options become available in the Material Properties Browser than is the case with objects that cannot receive textures. Objects that can receive textures can also assume a new color that can be visible through the texture.

➔ To change the properties of a textured material in the Material Properties Browser:

1. Do not change the *Render backface* option unless surfaces appear to be missing from the object. Check the *Render backface* option to render both sides of a surface. Only check this option when necessary since it will increase the time to render your project.
 - Decide whether an object should provide its own illumination. This is useful for low-level light sources such as neon; however, you can check the *Self-illuminate* option for any materials.
2. Decide whether to make the texture dominant or let a color show through the texture.
 - Make the black areas of a texture appear as voids by checking the *Texture masks object* box.
 - Let the color mix with the texture by checking the *Mix texture with rendered color* box. If you select this option, use the Color Picker to experiment with colors.

Figure 4.11: The honey yellow shade lightens the wood texture of the cabinets.

3. Decide whether to reflect the texture on the surface by checking *Apply texture as reflection map* box.

- If you select this option, the texture will appear as if it were being reflected on the surface. This option is useful for simulating shiny metal such as brushed aluminum or stainless steel.
 - If you want to control the shine, you can click on the Matte, Glossy, or Glass buttons. When you click on one of these buttons, you also affect the slider bar values for Ambient, Diffuse, Reflection, Opacity, and Refractive Index.
4. Decide whether to change the file that controls the texture. If you have a BMP or JPEG file you would like to substitute, click on the folder icon in the Material Properties Browser. The Load Texture dialog box appears. You can browse through the BMP and JPEG files to preview a new texture. Just click on Open or press [Enter] to make it take effect in your Player Window.

The scale of a texture is determined by the original author of the object and cannot be changed in o2c_Interactive!. The resolution of a texture has no effect on its scale.

Figure 4.12: When you browse through the BMP or JPEG files available from various sources, you may find a texture that you like.

The slider bars in the Material Properties Browser give you direct control of several aspects of the project in the Player Window.

➔ To enhance material properties by using the slider bars:

1. Click on the square for the material properties value you want to change. The square blinks until you click on a different slider category.
2. Drag the bar and watch the effect it has on the project in the Player Window. Alternatively, you can use the [Left Arrow] key or the button on the left of a slider bar to decrease the value; use the [Right Arrow] key or the button on the right of a slider bar to increase the value.
3. Use a combination of values to produce the effect you want.
 - Ambient Increase this value to simulate plastic
 - Diffuse Decrease this value to simulate velvet

- Reflection Increase this value to simulate glossy surfaces such as chrome
- Opacity Increase this value to simulate transparent materials such as glass
- Refractive Index Less than 10 simulates water; 10 equals air; more than 10 simulates glass

Changing Colors

You can use either the [Material Browser color palette](#) or the [Color Picker](#) to change the color of an object.

Using the Material Browser for Color Change

➔ To change an object's color in the Material Browser:

1. Display the materials list (make sure the first icon in the Material Browser is active). Then, highlight the item you want to change. Alternatively, you can click on the item you want to change in the Player Window to highlight the appropriate material in the Material Browser list.
2. Click on the color icon (the fourth icon from the left in the Material Browser). The 255-color custom palette appears.
3. Right-click within the palette to display the three color types and check the one you want to use:
 - DataCAD
 - DXFDWG
 - Prizma
4. Use the slider bar to display more swatches within the color palette you selected.
5. Click on the color swatch you want to use on the item(s) you highlighted in step 1.

Figure 4.13: The Prizma color palette is displayed in the Material Browser.

When you select a color from the Material Browser, you can see its values displayed in the Color Picker.

Using the Color Picker for Color Change

➔ To change an object's color in the Color Picker:

1. Select the object you want to work with in the Player Window or from the Material Browser's material list.
2. Click the color you want on the cube in the Color Picker. If you want to see more options, right-click and drag on the cube to reveal other faces. The color you selected appears on the object(s) in the Player Window and in the bottom left color swatch, next to the swatch that shows the old color.
3. Use the slider on the right side of the Color Picker to further refine the color. The slider helps adjust a color's brightness.

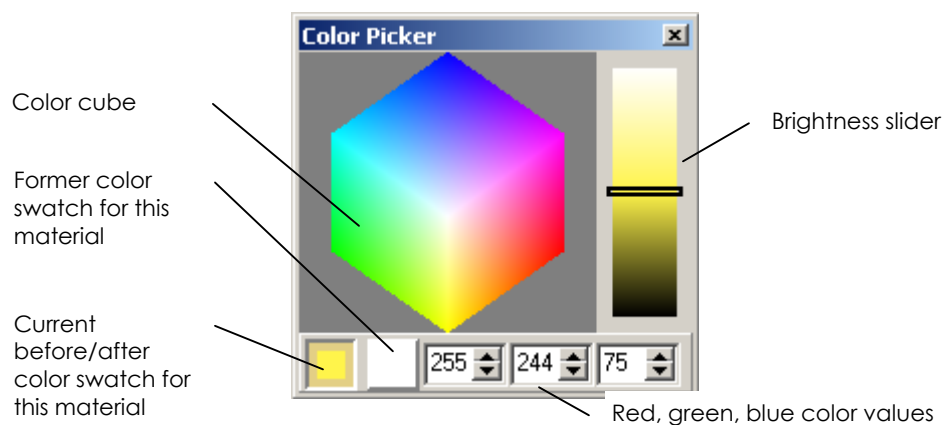

Figure 4.14: The Color Picker

The red, green, and blue color values are displayed in the input boxes at the bottom of the Color Picker.

Copying and Pasting Color Definitions for Materials

You can use a material definition from one object and apply it to another by using the copy and paste functions available in the Material Browser.

➔ To copy a material definition from the Material Browser list:

1. Highlight the cube (leftmost) icon to display the list of objects.
2. Click on the object in the list that you want to copy.
3. Right-click to reveal a pop-up menu.
4. Select Copy Material from the pop-up menu.

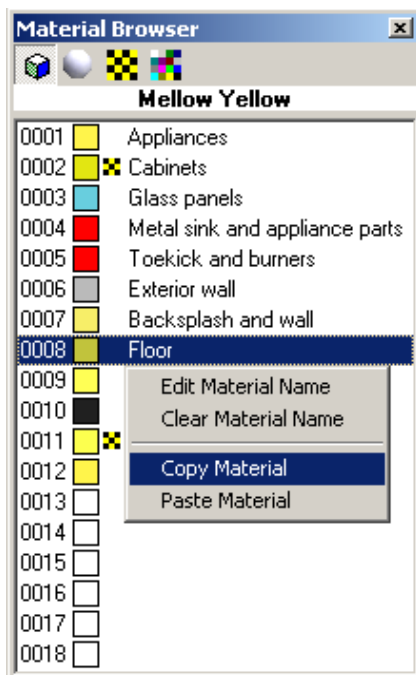

Figure 4.15: Right-click and select Copy Material from the pop-up menu.

➔ To paste a color definition you copied onto another object in the Material Browser list:

1. Highlight the cube (leftmost) icon if it isn't already selected.
2. Click on the object in the list that you want to receive the material definition you copied in the previous set of steps.
3. Right-click to reveal a pop-up menu.
4. Select Paste Material from the pop-up menu. o2c _Interactive! pastes the definition onto the object you highlighted in step 1.

If you selected an item that contains texture definitions, only the color definition will be pasted onto the second object. The texture definitions cannot be copied and pasted. You can also use the keyboard shortcuts [Ctrl] + [C] for copy and [Ctrl] + [V] for paste for the material definition.

Controlling Lights

In a design scheme, lighting is an important element. There are six lighting effects on the icon toolbar. In addition, there is the *Self-illuminate* option in the Material Properties Browser, which we have already discussed. So, let's look at what the toolbar light icons can do.

Figure 4.16: Light icons

These six icons are toggle switches that turn a lighting effect on or off. You can activate several of these toggles simultaneously.

- Sun – toggles sunlight on and off
- Ambient lights 1, 2, and 3 – toggles ambient lighting on and off
- Lamp – toggles interior lighting on and off
- Sun/moon – switches between day and night lighting

The sunlight (leftmost) and day/night (rightmost) icons control external light sources. The most dramatic change occurs when you toggle between day and night lighting because the background changes to either a blue or starlit sky respectively. The sunlight icon works when the day/night icon is switched to the day option to show what the interior would look like on a sunny or cloudy day.

The three ambient lights and the lamps icon affect the brightness of the interior. These four light sources can either be turned on simultaneously or toggled on or off separately to produce different effects.

Updating a Scheme

When you have made changes to a scheme, you should update it. It is also a good idea to check the list in the Material Browser and study the refinements indicated in the Material Properties Browser for each type of item in the current scheme.

➔ To update and save changes you made to a scheme:

1. Make changes to a scheme.
2. Select Save from the Scheme pull-down menu. The changes you made to the scheme are saved.

Locking and Unlocking a Scheme

You can lock a scheme to prevent making alterations. Later, you can unlock the scheme for internal use.

➔ To lock a scheme:

1. Click on the scheme you want to lock in the Schemes portion of the Views/Schemes Browser.
2. Right-click to display a pop-up menu.

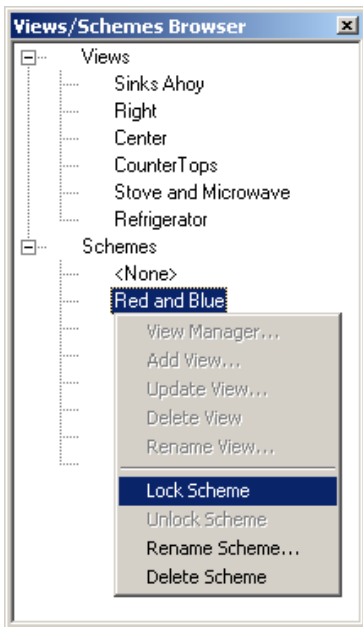

Figure 4.17: Lock Scheme

3. Select Lock Scheme. A padlock appears in front of the scheme you locked.

➔ To unlock a scheme:

1. Click on the padlock in front of the scheme you want to unlock in the Schemes portion of the Views/Schemes Browser.
2. Right-click to display a pop-up menu.

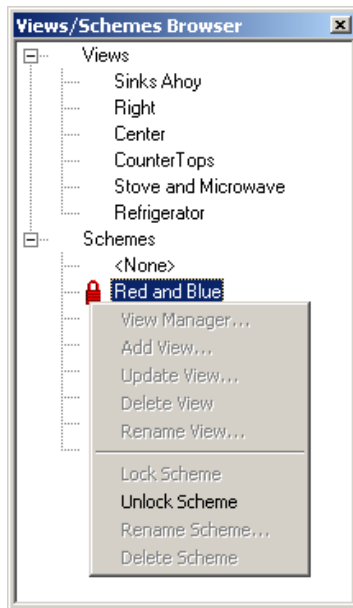

Figure 4.18: Unlock Scheme

3. Select **Unlock Scheme**. The padlock disappears from the Views/Schemes Browser.

Raytracing

To see the way color, texture, and material definitions affect the appearance of your project, you can use raytracing. Raytracing renders the model in your Player Window.

Depending on the complexity of your project, the number of design elements, and the processing speed of your computer, raytracing can take several minutes. Once you start raytracing, you can press [Esc] to halt the procedure.

➔ To raytrace your project:

- Click on the Raytrace icon on the Toolbar.

Or

- Click on the [R] button in the lower left corner of the Controlbars.

Batch Rendering

You can render several views simultaneously. Since this may take a lot of time (depending on the number of views, their complexity, and your computer's processing speed), you could schedule this to occur after office hours.

➔ To render a group of views simultaneously:

1. Select **Batch Render** from the File pull-down menu. The Batch Rendering dialog box appears.

2. Check the views that you want to render; remove the check from views you do not want to render. Since o2c_Interactive! assumes that you want to render everything, it checks all the views. The Select all button checks all boxes; the Clear all button removes the checkmark from all boxes.
3. Set the width and height in pixels for the final images in the input boxes. The higher the value, the greater the resolution or detail and the longer it will take to render the views.
4. Decide on the level of output quality you want: Low, Medium, or High. The Low, Medium, and High settings affect how much sampling will occur during rendering to smooth the edges of polygons. In most cases, a setting of Low or Medium is sufficient to produce a high-quality image. The High setting should be used rarely because it can greatly increase the time to render (an hour or more in some cases) and achieves only a slightly better result than the Medium setting.
5. Check the Raytrace box if you want to render the views with shadows and reflections. Remember that raytracing will require more time.
6. Select the Output format you prefer from the drop-down options: BMP, JPG, PNG, TGA, TIFF, or PCX files.
7. Click on <New> in the Batch Name drop-down box, choose the Save button to display the Batch Session Name dialog box, supply a name in the input box. Use only the upper- or lower-case letters, the numbers 0 through 9, and/or spaces for the view name. Do not use any punctuation marks.
8. Click on OK or press [Enter].

Figure 4.19: The Batch Session Name dialog box

You can have several different batch session names that contain one or more views. For each batch name you want to add, click on <New>, choose the Save button, supply a name, and press [Enter]. If you want to change the options that apply to one of the batches, select the name from the pull-down list, and click on Save. If you want to delete one of the options from the Batch Session Name drop-down box, select the name and click on Delete.

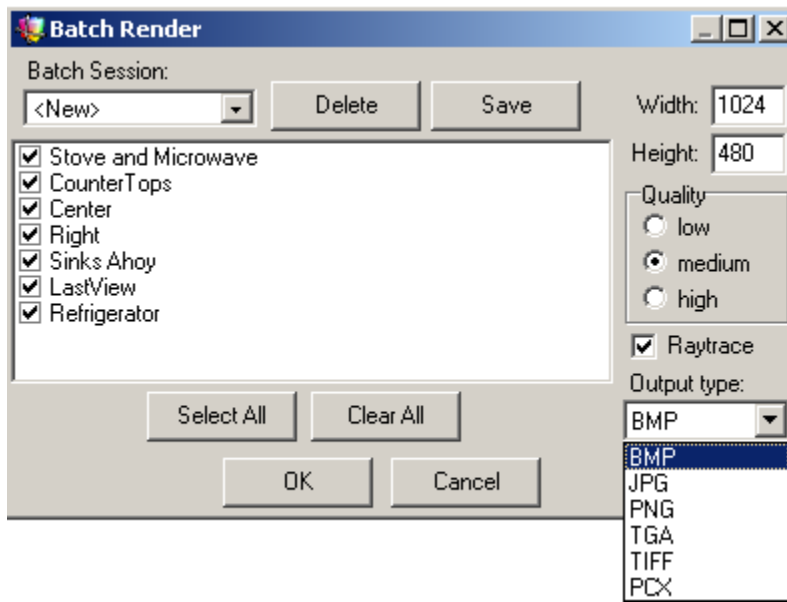

Figure 4.20: The Batch Rendering dialog box

9. Click on OK to start rendering all the views you checked in the batch.

Fine-tuning o2c_Interactive!

Going beyond the basics lets you further control your design project with o2c_Interactive!. For example, you can walk through your project to see it from different angles or create a slideshow.

The View Manager lets you control your project to coordinate design schemes, backgrounds, and views. Publishing your project on the internet lets clients download your designs.

In this chapter:

- ⊕ [Setting up defaults](#)
- ⊕ [Walking through your project](#)
- ⊕ [Customizing saved views](#)
- ⊕ [Publishing to the web](#)
- ⊕ [Creating a slideshow of images](#)

Setting Default Options for o2c_Interactive!

You can customize the way the o2c_Interactive! backgrounds appear in your Player Window. For example, you may have special “wallpaper” that features your company’s logo that you would prefer.

➔ To customize program options:

1. Select Program Options from the File pull-down menu. The Program Options dialog box appears.
2. Set the daytime/nighttime background options you prefer.
 - *Enable Day/Night Background Color/Image* - If you want a constant background that doesn’t change whether it is day or night, click in the box to remove the default checkmark.
 - *Daytime Background Color/Image* - Click on the color swatch to display the Color dialog box. Select the color you prefer from the Basic Color samples or click within the color spectrum square and/or drag the hue slider bar. The shade you selected appears in the Color Solid box. Click on OK or press [Enter] when you are satisfied with the color. The Color dialog box closes and the color you selected appears in the daytime swatch in the Program Options dialog box.

Figure 5.1: The Color dialog box

Click on the folder icon to display the Select Daytime Background Image dialog box. Select the image you prefer from those offered in the Background folder or open a different folder on your computer that contains .BMP or .JPG files that you prefer. For example, you may have your company’s logo embedded on a daytime sky background. When you are satisfied with the background that appears in the Preview window, click on Open or press [Enter]. The dialog box closes and your selection appears in the file input box in the Program Options dialog box. If you do not want a daytime background image, delete the file name from the input box.

Figure 5.2: The Select Daytime Background Image dialog box

- *Nighttime Background Color/Image* – Click on the color swatch to display the Color dialog box. Select the color you prefer from the Basic Color samples or click within the color spectrum square and/or drag the hue slider bar. The shade you selected appears in the Color Solid box. Click on OK or press [Enter] when you are satisfied. The color you selected appears in the nighttime swatch in the Program Options dialog box.

Click on the folder icon to display the Select Nighttime Background Image dialog box. Select the image you prefer from those offered in the Background folder or open a different folder that contains .BMP or .JPG files that you prefer. When you are satisfied with the background that appears in the Preview window, click on Open or press [Enter]. Your selection appears in the file input box in the Program Options dialog box. If you do not want a nighttime background image, delete the file name from the input box.

3. Select the Alternate Texture Path you prefer by clicking on the folder icon to display the Alternate Texture Folder dialog box. Click on the folder that contains texture files you want to use. Press [Enter] or click on OK to close the Alternate Texture Folder dialog box. The folder you selected appears in the Alternate Texture Path input box.

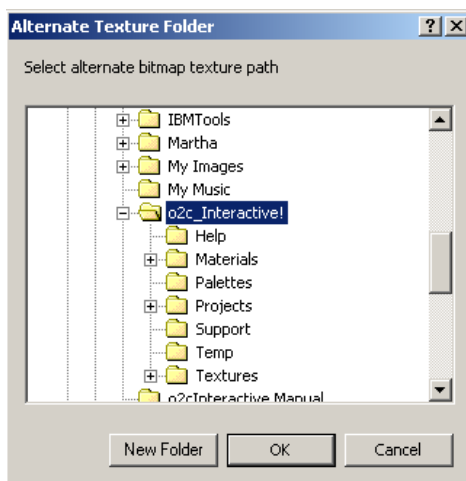

Figure 5.3: Select a folder that contains texture bitmap files you want o2c_interactive! to use.

4. Choose a different Highlight Color by clicking on the swatch to display the Color dialog box (see Figure 5.1).
5. Set a new Rotation Speed for the navigation cursor by clicking on the increase/decrease arrows. The greater the value, the faster the rotation.
6. Decide whether you want to hide undocked toolbars when the o2c_Interactive! application is inactive. If you do not want to hide them, make sure there is no checkmark in the box in the Undocked Toolbars portion of the Program Options dialog box. For example, if you reduce the size of the o2c_Interactive! screen and move the undocked toolbars to your desktop, you can click on the desktop to inactivate the program and hide the undocked toolbars. This allows you to switch to another application on your desktop without worrying about the clutter of the undocked o2c_Interactive! toolbars.
7. Press [Enter] or click on Ok when you are satisfied with all your selections in the Program Options dialog box. These decisions will take effect as o2c_Interactive! defaults.

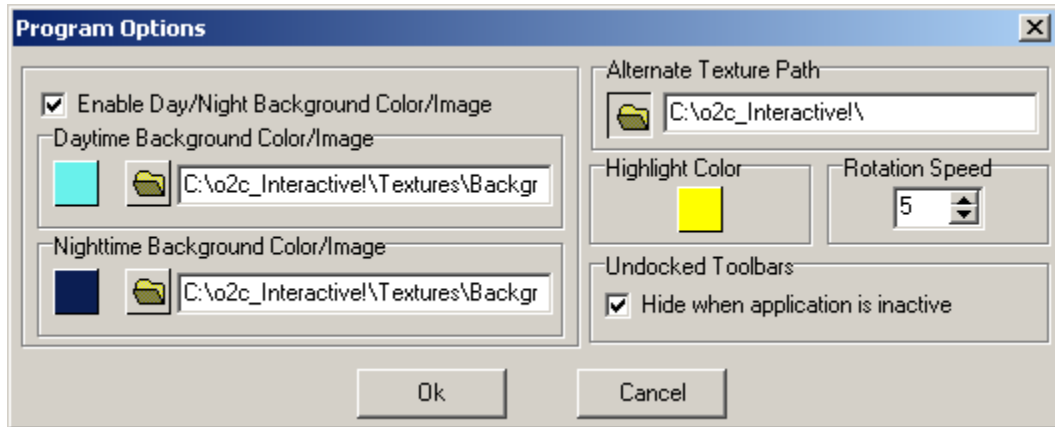

Figure 5.4: Program Options dialog box

If you supplied a file name for either the daytime or nighttime background, the image you selected will appear in the background of your design when you click on the Day/Night icon on the Lights Toolbar. If you supplied both a color and file name for the daytime or nighttime background, the image is dominant and will appear in the background.

- ➔ To temporarily use the daytime or nighttime background color instead of the dominant background image:
1. Right-click in the background portion of the Player Window. A menu appears.

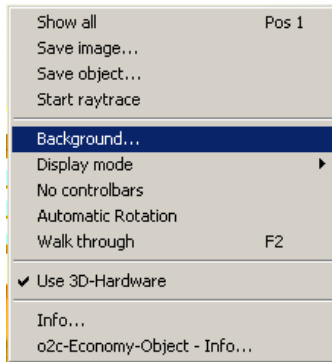

Figure 5.5: Right-click on the background in the Player Window to display this menu.

2. Select Background . . . from the menu. The Background dialog box appears. Notice that the Background picture option is activated.
3. Click in the radio button before Monochrome.

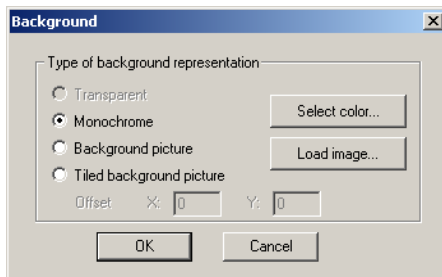

Figure 5.6: Select Monochrome if you want the background to display a color instead of a picture or image.

4. Click on OK or press [Enter]. The background in the Player Window is the color you designated when you customized the o2c_Interactive! program defaults.

This is not a permanent change; it affects only the current view of your project. The next time you click on the Day/Night icon in the Lights Toolbar, the background image will once again take precedence. To permanently display a background color rather than an image, you must delete the file name(s) in the input boxes for Daytime Background Color/Image and Nighttime Background Color/Image.

Walking Through Your Design

With the Walk Through option, o2c_Interactive! lets you tour the project. You can walk toward or away from the design, turn right or left, step up or down or to one side, or look up or down or to one side.

➔ To walk through your design:

1. Prepare your design for the walk through by clicking on either the Isometric or Axonometric icon cube in the View Toolbar.

2. Select the navigation cursor icon and use it to position yourself for the walk through. Use the rotating feature or right-click and drag up or down until you are ready to start the walk through.
3. Right-click within your project to display the menu shown in Figure 5.5.
4. Click on Walk through. The navigation cursor changes so that you can tour your project with the aid of your mouse and the keyboard.
5. Move your cursor to the middle of your Player Window until it changes to  .
6. Use the [Arrow], [Shift], and [Ctrl] keys to move around your design.
 - [Up Arrow] moves forward
 - [Down Arrow] moves backward
 - [Right Arrow] moves to the right
 - [Left Arrow] moves to the left
 - [Shift] + [Arrow] moves at a slower rate
 - [Ctrl] + [Arrow] moves at a faster rate
 - [Ctrl] + [Shift] + [Arrow] moves even faster

Using the walk through function requires practice. Try walking through a simple room to experiment.

Depending on your cursor's position within the Player Window, it will assume one of these shapes:

 lets you move in different directions

 lets you rotate your position

 lets you go forward, backward, right, or left with the [Arrow] keys

Working with Saved Views

Customizing Saved Views

You can control the views and associate them with specific schemes and backgrounds with the View Manager.

➔ To customize saved views:

1. Select View Manager from the View pull-down menu. The View Manager dialog box appears. Views that you created are listed in the box.

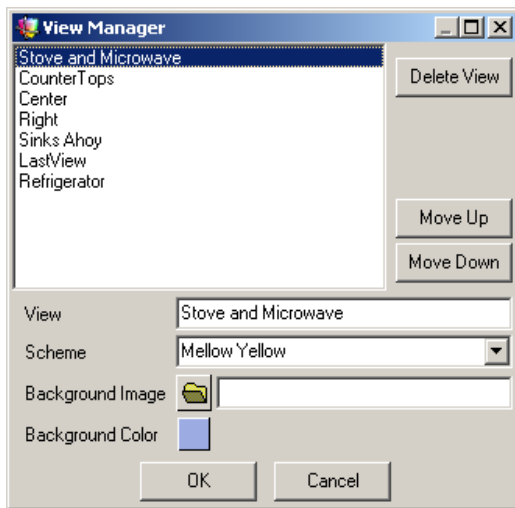

Figure 5.7: The View Manager dialog box

2. Highlight the view you want to customize.
3. Decide how you want to customize the view using these options:
 - *View* – You can rename the currently selected view. In the View input box, delete the old name and type the new. Use only the upper- or lower-case letters, the numbers 0 through 9, and/or spaces for the view name. Do not use any punctuation marks. Press [Enter] to make this change appear in the View Manager’s list box.
 - *Scheme* – Select the scheme you want to associate with the highlighted view from the options available in the drop-down box.
 - *Background Image* or *Background Color* – These two options are mutually exclusive. If no name appears in the background image input box, o2c_Interactive! uses the color in the swatch as the view’s background. To choose a different background color, click on the swatch and make your selection from the Color dialog box (see Figure 5.1).

If a name appears in the background image input box, it takes precedence. Click on the folder icon and use the Select Background Image for View dialog box to browse for an appropriate .BMP or .JPG file to use as a background image.

Figure 5.8: Browse through folders to select a background image .BMP or .JPG file.

4. Repeat steps 2 and 3 for each view in the list that you want to customize.
5. Reposition a view in the list by highlighting it and clicking the Move Up or Move Down buttons until you are satisfied. Repeat this for other views you want to move up or down in the list.
6. Click on OK when you have finished making changes in the View Manager dialog box.

Deleting a View

If you want to eliminate a view you have created, you need to use the View Manager. You can also use the context menu in the Views/Schemes Browser to delete a view.

➔ To delete a view:

1. Select View Manager from the View pull-down menu. The View Manager dialog box appears. Views that you created are listed in the box.
2. Highlight the view you want to delete.
3. Click on the Delete View button in the View Manager dialog box. The view disappears from the View Manager's list immediately, but it is still visible in the Views/Schemes Browser.
4. Click on OK. Now, the view you deleted in step 3 disappears from the Views listing in the Views/Schemes Browser.

As you can see by comparing figures 5.7 and 5.9, we eliminated one view and rearranged the remaining ones.

Figure 5.9: Compare this with Figure 5.7 to see how Views were repositioned or deleted from the current design project.

Publishing to a Website

The designs you created using o2c_Interactive! can be published to a website so that your clients can view them and decide whether they want changes. You can publish views and/or schemes or images or both. Also, when you create a slideshow based on your designs, you can set the time between slides.

Publishing Views and Schemes to a Website

You can publish selected views and schemes to a website. All the views and schemes you created in your design project appear in the Publish to Web dialog box. Initially, all of the views and schemes are selected because there is a checkmark in each box that precedes a view or scheme name.

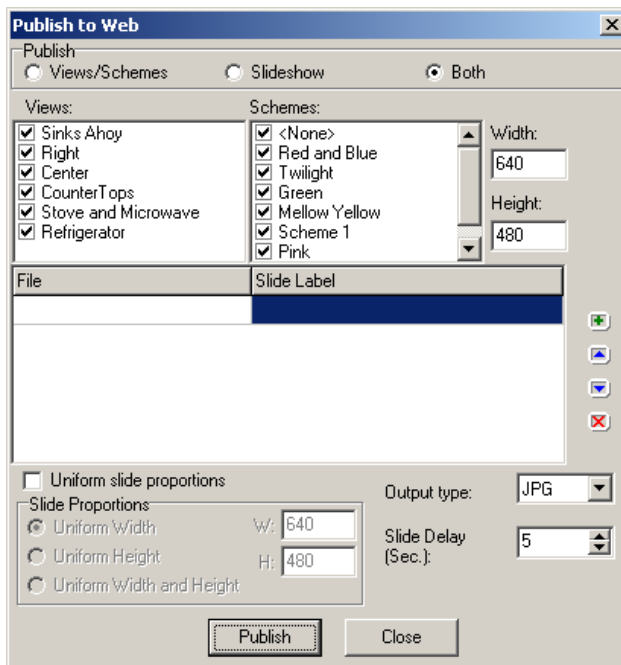

Figure 5.10: The Publish to Web dialog box

➔ To publish selected views and schemes to a website:

1. Select Publish to Web from the File pull-down menu. The Publish to Web dialog box appears.
2. Click on the Views/Schemes button in the Publish section of the dialog box. The Views and Schemes sections are activated; the rest of the options are grey or unavailable.
3. Make sure that checkmarks appear in front of all the views and/or schemes that you want to publish. Remove checkmarks from other views and/or schemes by clicking in the box. If you change your mind, simply click in the box again to make the checkmark appear.
4. Change the values in the Width and Height input boxes to indicate the pixel size you want to appear on the website.
5. Click on the Publish button at the bottom of the dialog box. The Save As dialog box appears.

6. Provide a name for the HTML file.

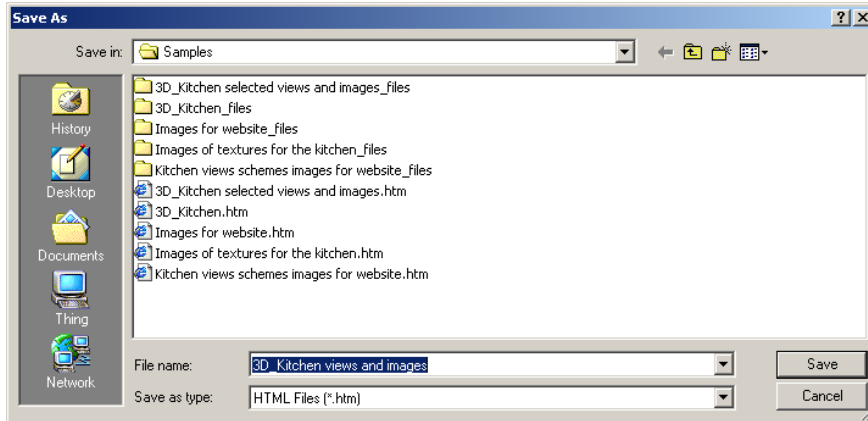

Figure 5.11: Provide a name for the HTML file you want to publish to a website.

7. Click Save or press [Enter]. In a few moments, the views and images appear in a website presentation screen.

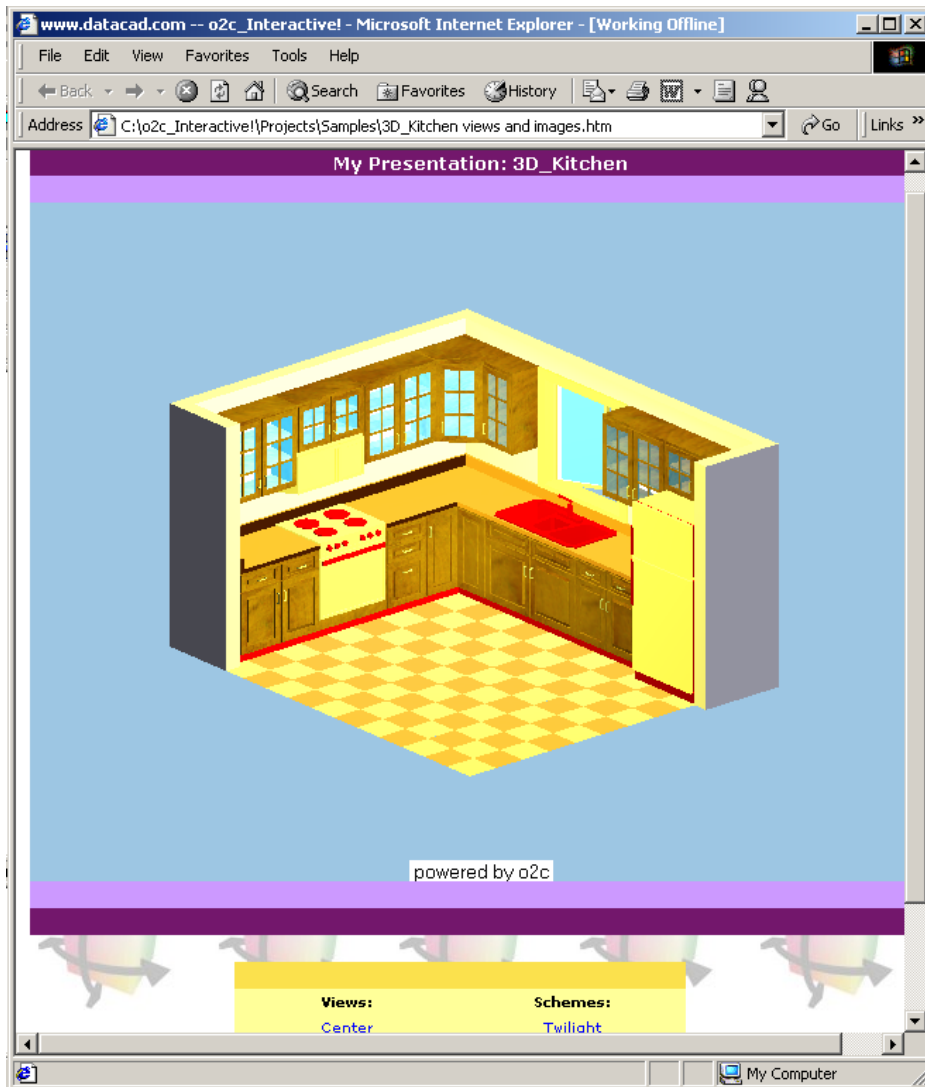

Figure 5.12: The website presentation screen.

8. Scroll down using the elevator bar on the website presentation screen to display the view and scheme names you published. If you provided more than one view and scheme in your presentation, your client will be able to experiment with the different design alternatives. Clicking and moving the mouse in the presentation window displays the navigation cursor that lets the client turn the design. Right-clicking and dragging the mouse forward or backward enlarges or shrinks the image.

Figure 5.13: The choice of views and schemes displayed at the bottom of the presentation window allows the customer to see different design alternatives.

9. Right-click in the presentation window to display a menu of options that your client can use. The most useful options are:
 - *Save image* - In the Save bitmap screen that appears, your client can save the presentation to a folder on his/her own computer or network.
 - *Start raytrace* - This produces a rendered image complete with reflections and shadows. See "[Raytracing](#)" in Chapter 4 for more information.
 - *Background* - The Background dialog box appears, allowing your client to change the color or image behind the design project. See "[Changing the Background](#)" in Chapter 3 for more information.

- *Display mode* – Your client can change to Wireframe or other modes. The o2c_Interactive! images are originally shown in the Shaded/textured display mode. See “[Changing the Display Mode](#)” in Chapter 3 for more information.
- *Walk through* – This lets your client tour the design. See “[Walking Through Your Design](#)” in this chapter for more information.

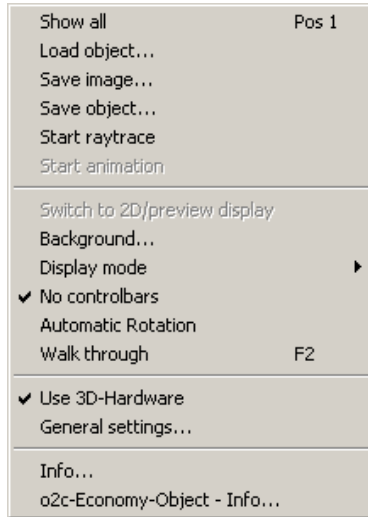

Figure 5.14: This menu appears when you right-click in the presentation window.

Publishing a Slideshow of Images to a Website

You can publish images to a website in much the same way as views and/or schemes; however, this involves other portions of the Publish to Web dialog box. These images will form a slideshow that your client can see on the web.

➔ To publish a slideshow of images to a website:

1. Select Publish to Web from the File pull-down menu. The Publish to Web dialog box appears.
2. Click on the Slideshow button in the Publish section of the Publish to Web dialog box. The File and Slide Label sections are activated. The Views and Schemes sections are grey or unavailable.
3. Click on the + button on the right side of the Publish to Web dialog box. The Select one or more files . . . dialog box appears.

4. ***Choose the image file(s) you want to publish to a website. Use the Look in drop-down box or the Up one level folder icon to help you find the file(s). Notice that the Files of type drop-down box offers several choices: Windows Bitmap (BMP), JPEG or Joint Photographic Experts Group (JPG), Portable Graphics (PNG), Targa (TGA) , Tagged Image File Format (TIFF) , Paint Shop Pro (PCX) , and Kodak Photo CD (PCD) . To select several consecutive files, hold down the [Shift] key while you click on the first and the last in the series. To select several random files, hold down the [Ctrl] key while you click on the different ones. Click on Open or press [Enter] to return to the Publish to Web dialog box. Notice that the file(s) you selected appear in the File (which contains the complete path) and the Slide Label (which contains only the name) sections of the Publish to Web dialog box.

You can select image files from just one folder at a time. If you want to select files from several different folders, you must repeat steps 3 and 4 as often as necessary. Select as many images as you want. If you go beyond six, you can use the controlbar to see the other files.

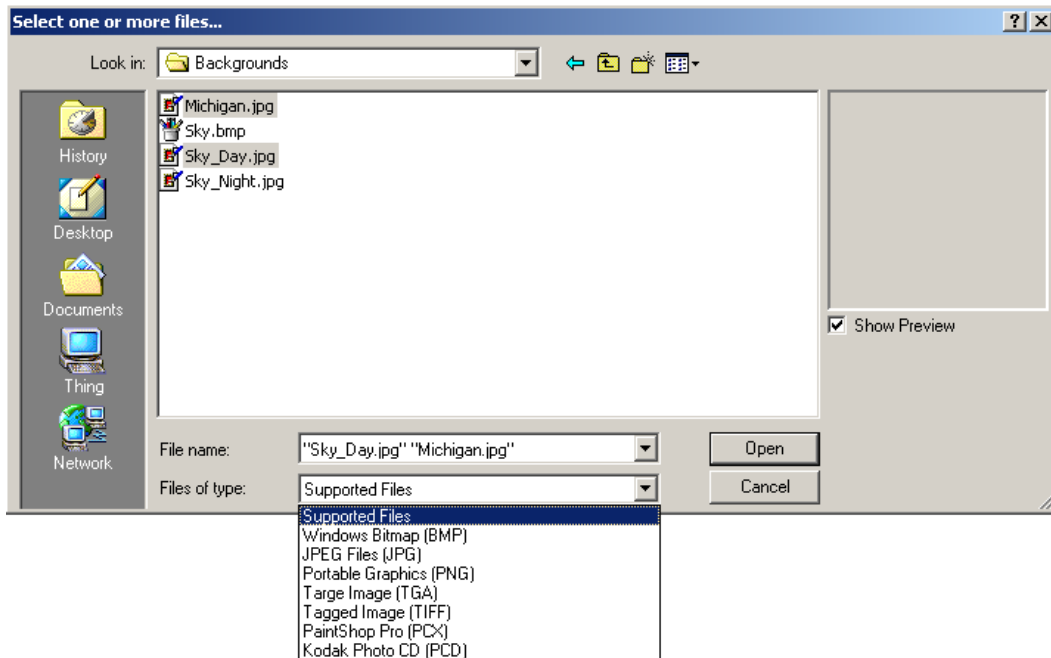

Figure 5.15: These two files were selected by depressing the [Ctrl] key while clicking on the file names.

5. Rearrange or delete image files from the list with the buttons on the right side of the Web Publishing dialog box. The - button lets you eliminate unwanted images from the list. The up and down arrow buttons let you rearrange the sequence of images. (For example, you may want to move the Sky_Night file below the Michigan file with the down arrow button and totally eliminate the Gravel file with the - button.)

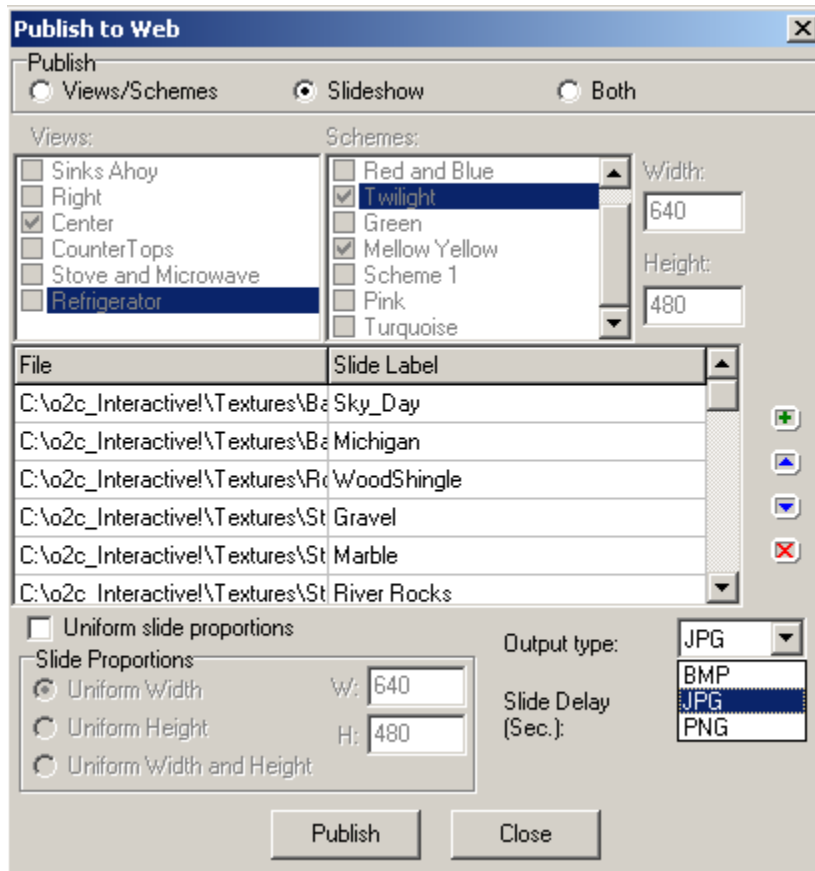

Figure 5.16: Image files from several different folders are included in the list.

6. Select BMP, JPG, or PNG from the Output type drop-down box. This controls the file type of the slideshow. Even if many of your image files are bitmaps, you can produce the slideshow as JPEGs or Portable Graphics.
7. Use the Slide Delay box to indicate the number of seconds between images.
8. Click Uniform slide proportions to place a checkmark in the box and to activate the options in the Slide Proportions portion of the Publish to Web dialog box. Making all slideshow images a uniform size will be more appealing to your clients. Click on one of the three round buttons and supply the pixel measurement(s) to indicate the size of all the images in your slideshow.
 - *Uniform Width* – All images will be the same width, but their heights may vary.
 - *Uniform Height* – All images will be the same height, but their widths may vary.
 - *Uniform Width and Height* – All images will be exactly the same width and height.

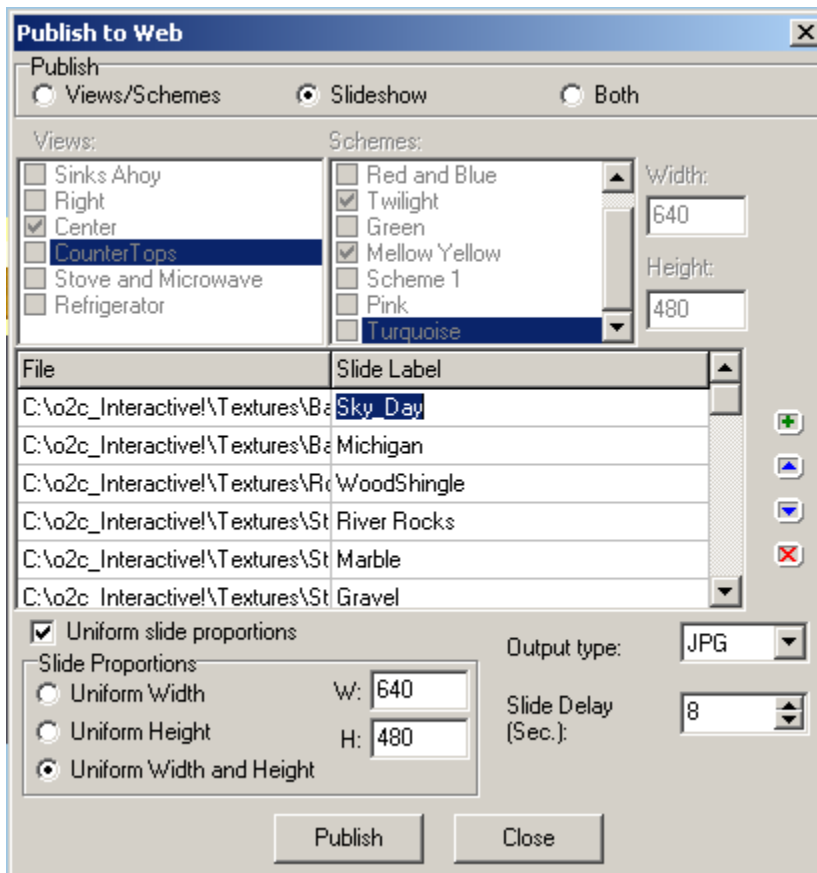

Figure 5.17: The slides will all be 640 X 480 pixels and appear at 8-second intervals.

9. Click on the Publish button when you are satisfied with your choices. The Save As dialog box appears.
10. Supply a name in the input field and press [Enter] or click on Save. The images appear in the My Slideshow window. Notice that the slideshow's file name appears in the Address box.
11. Press the Start button to run the slideshow automatically or use the arrow buttons to go backward or forward one slide at a time or to the end or beginning of the show. Use the Stop button to halt the show. Use the pull-down box to select the image you want to display.

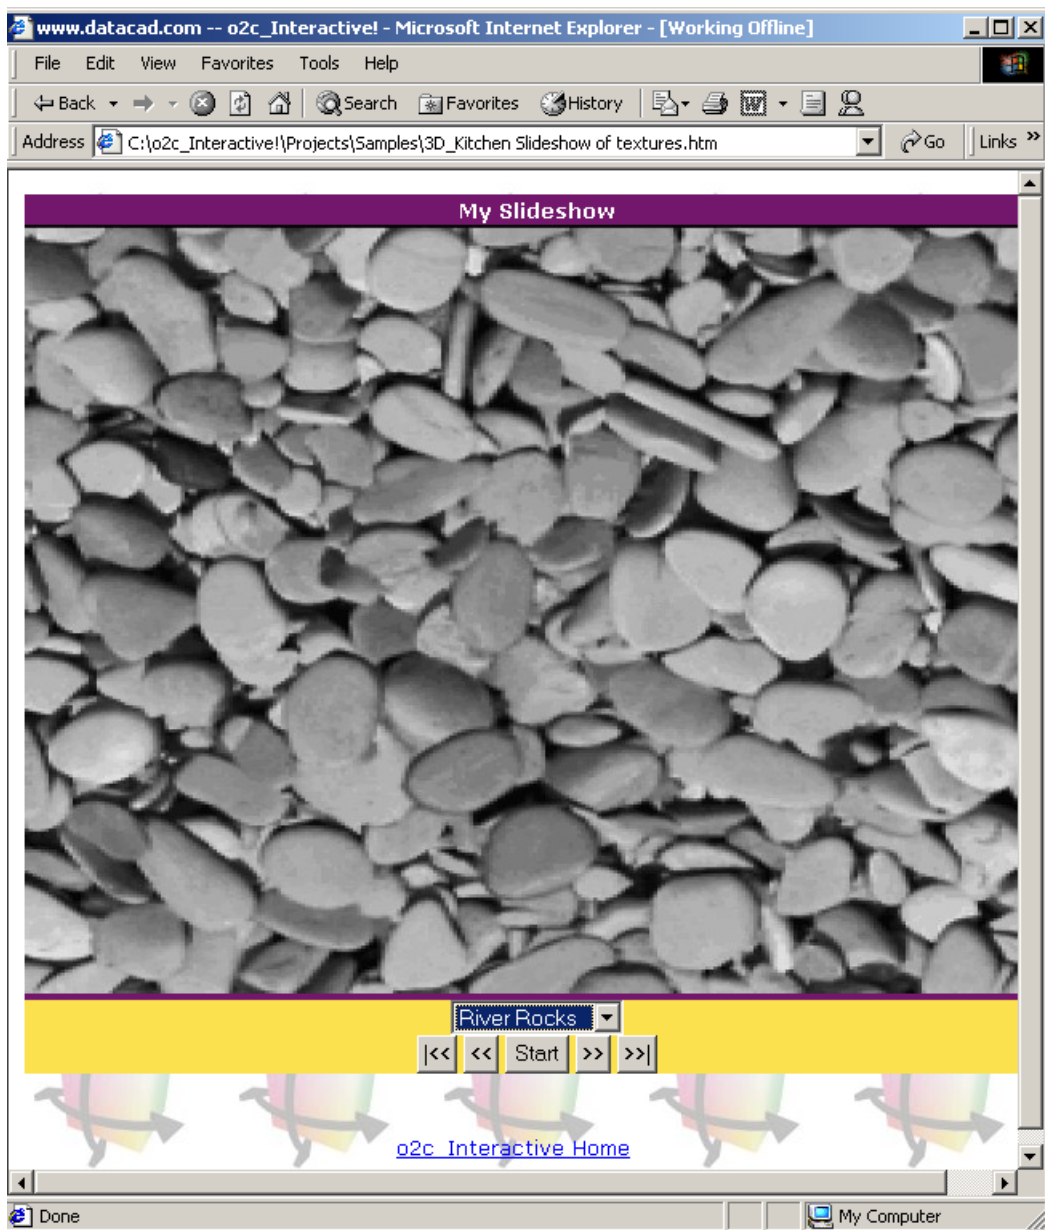

Figure 5.18: The slideshow of images is ready to roll.

You can create a slideshow with both views and schemes from the upper portion of the Publish to Web dialog box and images from the lower portion. To do this, just click on the Both button in the Publish portion.
